

Software Engineering I (02161)

Week 4

Assoc. Prof. Hubert Baumeister

DTU Compute
Technical University of Denmark

Spring 2017

Recap

- ▶ week 1: Introduction
- ▶ week 2: Requirements: Domain model, Use Cases
- ▶ week 3:
 - ▶ Requirements: User stories, from use cases to user stories
 - ▶ Test: Acceptance tests

Contents

Test Driven Development

- Test Driven Development

- Example of Test-Driven Development

Refactoring

How calendars and dates work in Java

Mock objects

Summary

Test-Driven Development

- ▶ Test *before* the implementation
- ▶ Tests = expectations on software
- ▶ All kind of tests: unit-, component-, system tests

Test-Driven Development

Traditional testing

Test-Driven Development

TDD cycle

- ▶ Repeat for functionality, bug, ... *red*

- ▶ Until: no more ideas for tests
- ▶ Important:
 - ▶ One test at a time
 - ▶ Implement only as much code so that the test does not fail.
 - ▶ If the method looks incomplete,
→ add more failing tests that force you to implement more code

Ideas for tests

1. Use case scenarios (missing functions): Acceptance tests
 2. Possibility for defects (missing code): Defect tests
 3. You want to write *more* code than is necessary to pass the test
 4. Complex behaviour of classes: Unit tests
 5. Code experiments: "How does the system behave, if ..."
- Make a list of new test ideas

documentation

TDD example: Borrow Book

► Use case

name: borrow book

description: the user borrows a book

actor: user

main scenario:

1. the user borrows a book

alternative scenario

1. the user wants to borrow a book, but has already 10 books borrowed
2. the system presents an error message

Create a test for the main scenario

- ▶ test data:
 - ▶ a user with CPR "1234651234" and book with signature "Som001"
- ▶ Test case
 - ▶ Retrieve the user with CPR number "1234651234"
 - ▶ Retrieve the book by the signature "Som001"
 - ▶ The user borrows the book
 - ▶ The book is in the list of books borrowed by that user

Create a test for the main scenario

```
@Test
public void testBorrowBook() throws Exception {
    String cprNumber = "1234651234";
    User user = libApp.userByCprNumber(cprNumber);
    assertEquals(cprNumber, user.getCprNumber());

    String signature = "Som001";
    Book book = libApp.bookBySignature(signature);
    assertEquals(signature, book.getSignature());

    List<Book> borrowedBooks = user.getBorrowedBooks();
    assertFalse(borrowedBooks.contains(book));

    user.borrowBook(book);

    borrowedBooks = user.getBorrowedBooks();
    assertEquals(1, borrowedBooks.size());
    assertTrue(borrowedBooks.contains(book));
}
```

Implement the main scenario

Only code that is needed to make the test pass

```
public void borrowBook(Book book) {  
    borrowedBooks.add(book);  
}
```

Create a test for the alternative scenario

- ▶ test data:
 - ▶ a user with CPR "1234651234", book with signature "Som001", and 10 books with signatures "book1", ..., "book10"
- ▶ Test case
 - ▶ Retrieve the user with CPR number "1234651234"
 - ▶ Retrieve and borrow the books with signature "book1", ..., "book10"
 - ▶ Retrieve and borrow the book by the signature "Som001"
 - ▶ Check that a TooManyBooksException is thrown

Implementation of the alternative scenario

```
public void borrowBook(Book book) throws TooManyBooksException {
    if (borrowedBooks.size() >= 10) {
        throw new TooManyBooksException();
    }
    borrowedBooks.add(book);
}
```

More test cases

- ▶ What happens if `book == null` in `borrowBook`?
- ▶ Test Case:
 - ▶ Retrieve the user with CPR number "1234651234"
 - ▶ Call the `borrowBook` operation with the `null` value
 - ▶ Check that the number of borrowed books has not changed

Final implementation so far

```
public void borrowBook(Book book) throws TooManyBooksException {
    if (book == null) return;
    if (borrowedBooks.size() >= 10) {
        throw new TooManyBooksException();
    }
    borrowedBooks.add(book);
}
```

Another example

- ▶ Creating a program to generate the n-th Fibonacci number
- Codemanship's Test-driven Development in Java by Jason Gorman

`http://youtu.be/nt2KKUSSJsY`

- ▶ Note: The video uses JUnitMax to run JUnit tests automatically whenever the test files change (`junitmax.com`)
- ▶ A tool with similar functionality but free is Infinittest (`https://infinittest.github.io`)

Refactoring

Refactoring

Refactoring Example

How calendars and dates work in Java

Mock objects

Summary

Refactoring and TDD

Technical debt

- ▶ Third step in TDD
- ▶ *restructure* the system without *changing* its functionality
- ▶ Goal: *improve* the design of the system, e.g. remove code duplication (DRY principle)
- ▶ Necessary step
- ▶ Requires good test suite

Refactoring

- ▶ PhD thesis by William Opdyke (1992): First tool: Smalltalk refactoring browser
- ▶ Book: *Refactoring: Improving the Design of Existing Code*, Martin Fowler, 1999
- ▶ Set of refactorings
 - ▶ e.g. **renameMethod**, **extractMethod**, **encapsulateField**, **encapsulateCollection**, ...
 - complete list <http://www.refactoring.com/catalog/index.html>
- ▶ Set of code smells
 - ▶ e.g. Duplicate Code, Long Method, Large Class, ...
 - <http://c2.com/cgi/wiki?CodeSmell>, or <http://www.codinghorror.com/blog/2006/05/code-smells.html>
 - ▶ How to write unmaintainable code
http://www2.imm.dtu.dk/courses/02161/2017/files/how_to_write_unmaintainable_code.pdf
- ▶ Decompose large refactorings into several small refactorings
 - ▶ Each step: compiles and passes all tests

Eclipse Refactoring Support

Menu in the code editor

- Different menus depending on selection

Example of Code smells

If it stinks, change it Refactoring, Martin Fowler, 1999

- ▶ Duplicate Code
- ▶ Long Method
- ▶ Large Class (God class)
- ▶ Switch Statements
- ▶ Comments
- ▶ ...

http://en.wikipedia.org/wiki/Code_smell

Code Smell: Switch Statement

```
public class User {  
    public double computeFine() {  
        double fine = 0;  
        for (Media m : borrowedMedia) {  
            if (m.overdue) {  
                switch (m.getType()) {  
                    case Media.BOOK : fine = fine + 10; break;  
                    case Media.DVD: fine = fine + 30; break;  
                    case Media.CD: fine = fine + 20; break;  
                    default fine = fine + 5; break;  
                }  
            }  
        }  
        return fine;  
    }  
}
```

Better Design

```
public class User {  
    public double computeFine() {  
        double fine = 0;  
        for (Media m : borrowedMedia) {  
            if (m.overdue) { fine = fine + m.getFine(); }  
        }  
        return fine;  
    }  
}  
  
abstract public class Media {  
    abstract public double getFine();  
}  
  
public class Book extends Media {  
    public double getFine() { return 10; }  
}  
  
public class DVD extends Media {  
    public double getFine() { return 30; }  
}  
  
public class CD extends Media {  
    public double getFine() { return 20; }  
}
```

MarriageAgency class diagram

- ▶ Refactoring example in detail
 - http://www2.imm.dtu.dk/courses/02161/2017/slides/refactoring_example.pdf
- ▶ Framework for running tests as soon as the code changes:
 - **Infinittest** <http://infinittest.github.io/>

Remark on refactoring

- ▶ A refactoring takes a system with green tests to a system with green tests
- ▶ Decompose a large refactoring into small refactorings
 - Don't have failing tests (or a broken system) for too long (e.g. days, weeks, ...)
 - ▶ Each small refactoring goes from a green test to a green test
 - ▶ Ideally, you can interrupt large refactorings to add some functionality and then continue with the refactoring

TDD: Advantages

- ▶ Test benefits
 - ▶ Good code coverage: Only write production code to make a failing test pass
 - ▶ Design benefits
 - ▶ Helps design the system: defines usage of the system before the system is implemented
- Testable system

Test Driven Development

Refactoring

How calendars and dates work in Java

Mock objects

Summary

How to use Date and calendar (I)

- ▶ Date class deprecated
- ▶ Calendar and GregorianCalendar classes
- ▶ An instance of Calendar is created by

```
new GregorianCalendar() // current date and time  
new GregorianCalendar(2017, Calendar.JANUARY, 10)
```

- ▶ Note that the month is 0 based (and not 1 based). Thus 1 = February.
- ▶ Best is to use the constants offered by Calendar, i.e. `Calendar.JANUARY`

How to use Date and calendar (I)

- ▶ One can assign a new calendar with the date of another calendar by

```
Calendar newCal = new GregorianCalendar();  
newCal.setTime(oldCal.getTime());
```

- ▶ One can add years, months, days to a Calendar by using add: e.g.

```
cal.add(Calendar.DAY_OF_YEAR, 28)
```

- ▶ Note that the system roles over to the new year if the date is, e.g. 24.12.2017
- ▶ One can compare two dates represented as calendars using **before** and **after**, e.g.

```
currentDate.after(dueDate)
```

Test Driven Development

Refactoring

How calendars and dates work in Java

Mock objects

Summary

Problems

- ▶ How to test that a book is overdue?

- ▶ Borrow the book today
- ▶ Jump to the date in the future when the book is overdue
- ▶ Check that the book is overdue

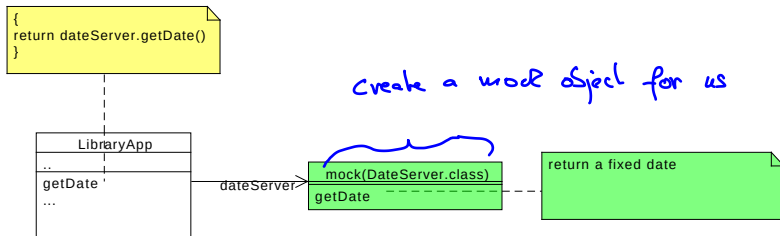

- ▶ How do we jump into the future?
- Replace the `GregorianCalendar` class by a *mock* object that returns fixed dates
- ▶ Problem: Can't replace `GregorianCalendar` class

Creating a DateServer class

Creating a DateServer class

- The DateServer can be mocked

Mock Example: Overdue book

```
@Test
public void testOverdueBook() throws Exception {
    DateServer dateServer = mock(DateServer.class);

    Calendar cal = new GregorianCalendar(2017, Calendar.JANUARY, 10);

    when(dateServer.getDate()).thenReturn(cal);

    libApp.setDateServer(dateServer);
    ...
    user.borrowBook(book);

    newCal = new GregorianCalendar();
    newCal.setTime(cal.getTime());
    newCal.add(Calendar.DAY_OF_YEAR, MAX_DAYS_FOR_LOAN + 1);
    when(dateServer.getDate()).thenReturn(newCal);

    assertTrue(book.isOverdue());
}
```

LibraryApp Code

```
public class LibraryApp {
    private DateServer ds = new DateServer();
    public setDateServer(DateServer ds) { this.ds = ds; }
    ...
}

public class DateServer {
    public Calendar getDate() {
        return new GreogorianCalendar();
    }
}
```

How to use

- ▶ Import helper methods

```
import static org.mockito.Mockito.*;
```

SomeClass
...
m1(args) m2(args)

- ▶ Create a mock object on class SomeClass

```
SomeClass mockObj = mock(SomeClass.class)
```

- ▶ return a predefined value for m1 (args)

```
when(mockObj.m1 (args)) .thenReturn (someObj) ;
```

- ▶ verify that message m2 (args) has been sent

```
verify (mockObj) .m2 (args) ;
```

Testing for e-mails

```
@Test
public void testEmailReminder() throws Exception {
    DateServer dateServer = mock(DateServer.class);
    libApp.setDateServer(dateServer);

    MailService mailService = mock(MailService.class);
    libApp.setMailService(mailService);

    ...
    libApp.sendEmailReminder();
    verify(mailService).send("...", "...", "...");
}
```

appropriate arguments

Verify

Check that no messages have been sent

```
verify(ms, never()).send(anyString(), anyString(), anyString());
```
