 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
 Conditional expectation
 The Bernoulli process
 Exercises/problems

- Stochastic experiments
- The probability triple $(\Omega, \mathcal{F}, \mathbb{P})$:
 - ◆ Ω : The sample space, $\omega \in \Omega$
 - ◆ \mathcal{F} : The set of events, $A \in \mathcal{F} \Rightarrow A \subset \Omega$
 - ◆ \mathbb{P} : The probability measure, $A \in \mathcal{F} \Rightarrow \mathbb{P}(A) \in [0, 1]$
- Random variables
- Distribution functions
- Conditioning

Why recap probability theory?

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
 Conditional expectation
 The Bernoulli process
 Exercises/problems

- Stochastic processes is *applied probability*
- A firm understanding of probability (as taught in e.g. 02405) will get you far
- We need a more solid basis than most students develop in e.g. 02405.

What to recap?

The concepts are most important: What is a stochastic variable, what is conditioning, etc.
 Specific models and formulas: That a binomial distribution appears as the sum of Bernoulli variates, etc.

The set-up of probability theory

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
 Conditional expectation
 The Bernoulli process
 Exercises/problems

We perform a *stochastic experiment*.
 We use ω to denote the outcome.
 The **sample space** Ω is the set of all possible outcomes.

The sample space Ω

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

Ω can be a very simple set, e.g.

- $\{H, T\}$ (tossing a coin a.k.a. Bernoulli experiment)
- $\{1, 2, 3, 4, 5, 6\}$ (throwing a die once).
- \mathbb{N} (typical for single discrete stochastic variables)
- \mathbb{R}^d (typical for multivariate continuous stochastic variables)

or a more complicated set, e.g.

- The set of all functions $\mathbf{R} \mapsto \mathbf{R}^d$ with some regularity properties.

Often we will not need to specify what Ω is.

Events

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

Events are sets of outcomes/subsets of Ω

Events correspond to statements about the outcome.

For a die thrown once, the event

$$A = \{1, 2, 3\}$$

corresponds to the statement "the die showed no more than three".

Probability

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

A Probability is a set measure of an event

If A is an event, then

$$\mathbb{P}(A)$$

is the probability that the event A occurs in the stochastic experiment - a number between 0 and 1.

(What exactly does this **mean**? C.f. G&S p 5, and appendix III)

Regardless of interpretation, we can pose simple conditions for **mathematical consistency**.

Logical operators as set operators

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

An important question: Which events are "measurable", i.e. have a probability assigned to them?

We want our usual logical reasoning to work!

So: If A and B are legal statements, represented by measurable subsets of Ω , then so are

- Not A , i.e. $A^c = \Omega \setminus A$
- A or B , i.e. $A \cup B$.

Parallels between statements and sets

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

Set	Statement
A	"The event A occurred" ($\omega \in A$)
A^c	Not A
$A \cap B$	A and B
$A \cup B$	A or B
$(A \cup B) \setminus (A \cap B)$	A exclusive-or B

See also table 1.1 in Grimmett & Stirzaker, page 3

An infinite, but countable, number of statements

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

For the Bernoulli experiment, we need statements like

At least one experiment shows heads

or

In the long run, every other experiment shows heads.

So: If A_i are events for $i \in \mathbb{N}$, then so is $\cup_{i \in \mathbb{N}} A_i$.

All events considered form a σ -field \mathcal{F}

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

Definition:

1. The empty set is an event, $\emptyset \in \mathcal{F}$
2. Given a countable set of events A_1, A_2, \dots , its union is also an event, $\cup_{i \in \mathbb{N}} A_i \in \mathcal{F}$
3. If A is an event, then so is the complementary set A^c .

(Trivial) examples of σ -fields

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

1. $\mathcal{F} = \{\emptyset, \Omega\}$
This is the deterministic case: All statements are either true ($\forall \omega$) or false ($\forall \omega$).
2. $\mathcal{F} = \{\emptyset, A, A^c, \Omega\}$
This corresponds to the Bernoulli experiment or tossing a coin: The event A corresponds to "heads".
3. $\mathcal{F} = 2^\Omega =$ set of all subsets of Ω .

When Ω is finite or enumerable, we can actually work with 2^Ω ; otherwise not.

Define probabilities $\mathbb{P}(A)$ for all events A

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

- $\mathbb{P}(\emptyset) = 0$, $\mathbb{P}(\Omega) = 1$
- If A_1, A_2, \dots are mutually excluding events (ie. $A_i \cap A_j = \emptyset$ for $i \neq j$), then

$$\mathbb{P}(\cup_{i=1}^{\infty} A_i) = \sum_{i=1}^{\infty} \mathbb{P}(A_i)$$

A $\mathbb{P} : \mathcal{F} \mapsto [0, 1]$ satisfying these is called a probability measure.
The triple $(\Omega, \mathcal{F}, \mathbb{P})$ is called a **probability space**.

Conditional probabilities

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

In stochastic processes, we want to know what to expect from the future, conditional on our past observations.

$$\mathbb{P}(A|B) = \frac{\mathbb{P}(A \cap B)}{\mathbb{P}(B)}$$

Be careful when conditioning!

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

If you are not careful about specifying the events involved, you can easily obtain wrong conclusions.

Example: A family has two children. Each child is a boy with probability 1/2, independently of the other. Given that at least one is a boy, what is the probability that they are both boys?

The meaningless answer:

$$\mathbb{P}(\text{two boys} | \text{at least one boy}) = \mathbb{P}(\text{other child is a boy}) = \frac{1}{2}$$

The right answer:

$$\mathbb{P}(\text{two boys} | \text{at least one boy}) = \frac{\mathbb{P}(\text{two boys})}{\mathbb{P}(\text{at least one boy})} = \frac{1/4}{3/4} = \frac{1}{3}$$

Lemma: The law of total probability

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

Let B_1, \dots, B_n be a *partition* of Ω

(ie., mutually disjoint and $\cup_{i=1}^n B_i = \Omega$)

Then

$$\mathbb{P}(A) = \sum_{i=1}^n \mathbb{P}(A|B_i)\mathbb{P}(B_i)$$

Independence

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables
 F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

Events A and B are called independent if

$$\mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B)$$

When $0 < \mathbb{P}(B) < 1$, this is the same as

$$\mathbb{P}(A|B) = \mathbb{P}(A) = \mathbb{P}(A|B^c)$$

A family $\{A_i : i \in I\}$ of events is called independent if

$$\mathbb{P}(\cap_{i \in J} A_i) = \prod_{i \in J} \mathbb{P}(A_i)$$

for any finite subset J of I .

Stochastic variables

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables
 F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

Informally: A quantity which is assigned by a stochastic experiment.

Formally: A mapping $X : \Omega \mapsto \mathbf{R}$.

A Technical comment We want the probabilities $\mathbb{P}(X \leq x)$ to be well defined. So we require

$$\forall x \in \mathbf{R} : \{\omega : X(\omega) \leq x\} \in \mathcal{F}$$

Examples of stochastic variables

Elements of basic probability theory
Why recap probability theory?

 F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

Indicator functions:

$$X(\omega) = I_A(\omega) = \begin{cases} 1 & \text{when } \omega \in A, \\ 0 & \text{else.} \end{cases}$$

Bernoulli variables:

$$\Omega = \{H, T\}, \quad X(H) = 1, \quad X(T) = 0.$$

F_X , the cumulated distribution function (cdf)

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory

Conditional probabilities

Stochastic variables
 F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

$$F(x) = \mathbb{P}(X \leq x)$$

Properties:

- $\lim_{x \rightarrow -\infty} F(x) = 0, \lim_{x \rightarrow +\infty} F(x) = 1.$
- $x < y \Rightarrow F(x) \leq F(y)$
- F is right-continuous, ie. $F(x+h) \rightarrow F(x)$ as $h \downarrow 0.$

Discrete and continuous variables

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory
Conditional probabilities

Stochastic variables
 F_X , the cumulated distribution function (cdf)

Discrete and continuous variables

Conditional expectation

The Bernoulli process
Exercises/problems

Discrete variables: $\text{Im}X$ is a countable set. So F_X is a step function. Typically $\text{Im}X \subset \mathbf{Z}$.

Continuous variables: X has a *probability density function* (pdf) f , i.e.

$$F(x) = \int_{-\infty}^x f(u) du$$

so F is differentiable.

A variable which is neither continuous nor discrete

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory
Conditional probabilities

Stochastic variables
 F_X , the cumulated distribution function (cdf)

Discrete and continuous variables

Conditional expectation

The Bernoulli process
Exercises/problems

Let $X \sim U(0, 1)$, i.e. uniform on $[0, 1]$ so that

$$F_X(x) = x \quad \text{for } 0 \leq x \leq 1.$$

Toss a fair coin. If heads, then set $Y = X$. If tails, then set $Y = 0$.

$$F_Y(y) = \frac{1}{2} + \frac{1}{2}x \quad \text{for } 0 \leq y \leq 1.$$

We say that Y has an *atom* at 0.

Mean and variance

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory
Conditional probabilities

Stochastic variables
 F_X , the cumulated distribution function (cdf)

Discrete and continuous variables

Conditional expectation

The Bernoulli process
Exercises/problems

The mean of a stochastic variable is

$$\mathbb{E}X = \sum_{i \in \mathbf{Z}} i \mathbb{P}(X = i)$$

in the discrete case, and

$$\mathbb{E}X = \int_{-\infty}^{+\infty} x f(x) dx$$

in the continuous case. In both cases we assume that the sum/integral exists absolutely.

The variance of X is

$$\mathbb{V}X = \mathbb{E}(X - \mathbb{E}x)^2 = \mathbb{E}X^2 - (\mathbb{E}X)^2$$

Conditional expectation

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory
Conditional probabilities

Stochastic variables
 F_X , the cumulated distribution function (cdf)

Discrete and continuous variables

Conditional expectation

The Bernoulli process
Exercises/problems

The conditional expectation is the mean in the conditional distribution

$$\mathbb{E}(Y|X = x) = \sum_y y f_{Y|X}(y|x)$$

It can be seen as a stochastic variable: Let $\psi(x) = \mathbb{E}(Y|X = x)$, then $\psi(X)$ is the conditional expectation of Y given X

$$\psi(X) = \mathbb{E}(Y|X)$$

We have

$$\mathbb{E}(\mathbb{E}(Y|X)) = \mathbb{E}Y$$

Conditional variance $\mathbb{V}(Y|X)$

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
Conditional expectation
 The Bernoulli process
 Exercises/problems

is the variance in the conditional distribution.

$$\mathbb{V}(Y|X = x) = \sum_y (y - \psi(x))^2 f_{Y|X}(y|x)$$

This can also be written as

$$\mathbb{V}(Y|X) = \mathbb{E}(Y^2|X) - (\mathbb{E}(Y|X))^2$$

and can be manipulated into (try it!)

$$\mathbb{V}Y = \mathbb{E}\mathbb{V}(Y|X) + \mathbb{V}\mathbb{E}(Y|X)$$

which **partitions** the variance of Y .

Random vectors

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
Conditional expectation
 The Bernoulli process
 Exercises/problems

When a single stochastic experiment defines the value of several stochastic variables.

Example: Throw a dart. Record both vertical and horizontal distance to center.

$$X = (X_1, \dots, X_n) : \Omega \mapsto \mathbf{R}^n$$

Also random vectors are characterised by the distribution function

$$F : \mathbf{R}^n \mapsto [0, 1]:$$

$$F(x) = \mathbb{P}(X_1 \leq x_1, \dots, X_n \leq x_n)$$

where $x = (x_1, \dots, x_n)$.

Example

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
Conditional expectation
 The Bernoulli process
 Exercises/problems

In one experiment, we toss two fair coins and assign the results to V and X .

In another experiment, we toss *one* fair coin and assign the result to *both* Y and Z .

V , X , Y and Z are all identically distributed.

But (V, X) and (Y, Z) are *not* identically distributed.

E.g. $\mathbb{P}(V = X = \text{heads}) = 1/4$ while $\mathbb{P}(Y = Z = \text{heads}) = 1/2$.

The Bernoulli process

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
 Conditional expectation
The Bernoulli process
 Exercises/problems

Start with working out one single **Bernoulli experiment**.

Then consider a finite number of Bernoulli experiments: **The binomial distribution**

Next, a sequence of Bernoulli experiments: **The Bernoulli process**.

Waiting times in the Bernoulli process: **The negative binomial distribution**.

The Bernoulli experiment

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
 Conditional expectation

The Bernoulli process
 Exercises/problems

A Bernoulli experiment models e.g. tossing a coin.

The sample space is $\Omega = \{H, T\}$.

Events are $\mathcal{F} = \{\emptyset, \{H\}, \{T\}, \Omega\} = 2^\Omega = \{0, 1\}^\Omega$.

The probability $\mathbb{P} : \mathcal{F} \mapsto [0, 1]$ is defined by (!)

$$\mathbb{P}(\{H\}) = p \quad .$$

The stochastic variable $X : \Omega \mapsto \mathbf{R}$ with

$$X(H) = 1 \quad X(T) = 0$$

is *Bernoulli distributed* with parameter p .

A finite number of Bernoulli variables

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
 Conditional expectation

The Bernoulli process
 Exercises/problems

We toss a coin n times.

The sample space is $\Omega = \{H, T\}^n$.

For the case $n = 2$, this is $\{TT, TH, HT, HH\}$.

Events are $\mathcal{F} = 2^\Omega = \{0, 1\}^\Omega$.

How many events are there? $|\mathcal{F}| = 2^{|\Omega|} = 2^{(2^n)}$ (a lot).

Introduce A_i for the event "the i 'th toss showed heads".

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
 Conditional expectation

The Bernoulli process
 Exercises/problems

The probability $\mathbb{P} : \mathcal{F} \mapsto [0, 1]$ is defined by

$$\mathbb{P}(A_i) = p$$

and by requiring that

the events $\{A_i : i = 1, \dots, n\}$ are independent.

From this we derive

$$\mathbb{P}(\{\omega\}) = p^k(1-p)^{n-k} \text{ if } \omega \text{ has } k \text{ heads and } n-k \text{ tails.}$$

and from that the probability of *any* event.

Elements of basic probability theory
 Why recap probability theory?
 The set-up of probability theory
 Conditional probabilities
 Stochastic variables F_X , the cumulated distribution function (cdf)
 Discrete and continuous variables
 Conditional expectation

The Bernoulli process
 Exercises/problems

Define the stochastic variable X as number of heads

$$X = \sum_{i=1}^n \mathbf{1}(A_i)$$

To find its **probability mass function**, consider the events

$$\mathbb{P}(X = x) \quad \text{which is shorthand for } \mathbb{P}(\{\omega : X(\omega) = x\})$$

This event $\{X = x\}$ has $\binom{n}{x}$ elements. Each $\omega \in \{X = x\}$ has probability

$$\mathbb{P}(\omega) = p^x(1-p)^{n-x}$$

so the probability is

$$\mathbb{P}(X = x) = \binom{n}{x} p^x (1-p)^{n-x}$$

Properties of $B(n, p)$

Elements of basic probability theory
Why recap probability theory?

The set-up of probability theory
Conditional probabilities

Stochastic variables
 F_X , the cumulated distribution function (cdf)

Discrete and continuous variables
Conditional expectation

The Bernoulli process
Exercises/problems

Probability mass function

$$f_X(x) = \mathbb{P}(X = x) = \binom{n}{x} p^x (1-p)^{n-x}$$

Cumulated distribution function

$$F_X(x) = \mathbb{P}(X \leq x) = \sum_{i=0}^x f_X(i)$$

Mean value

$$\mathbb{E}X = \mathbb{E} \sum_{i=1}^n \mathbf{1}(A_i) = \sum_{i=1}^n \mathbb{P}(A_i) = np$$

Variance

$$\mathbb{V}X = \sum_{i=1}^n \mathbb{V}\mathbf{1}(A_i) = np(1-p)$$

because $\{A_i : i = 1, \dots, n\}$ are (pairwise) independent.

Problem 3.11.8

Discrete and continuous variables
Conditional expectation

The Bernoulli process

Exercises/problems

We need be precise in our use of probability theory, at least until we have developed intuition.

When in doubt, ask: What is the stochastic experiment? What is the probability triple? Which event am I considering?

Venn diagrams a very useful. This holds particularly for conditioning, which is central to stochastic processes.

Indicator functions are powerful tools, once mastered.

You need to know the distributions that can be derived from the Bernoulli process: The binomial, geometric, and negative binomial distribution.
