Abstract

A study planning system is intended to support automated study planning helping students to elaborate a plan for their course of study. At the time being it is an overwhelming task for the individual student to plan his course of study more than just a couple of terms ahead and a tool for supporting study planning is thus urgently needed.

In this thesis the domain of study planning is thoroughly analyzed from a student's point of view using the Technical University of Denmark as starting point. The analysis is conducted by means of Unified Modelling Language (UML) class diagrams and careful descriptions. A requirements specification is prepared posing requirements with respect to data, functionality and quality. In addition a number of other requirements are stated e.g. legal requirements.

On the basis of the requirements specification a fully-fledged study planning system is implemented. The system is highly configurable, supports various cultures and is based on a 3-tier architecture. The employed development platform is the Microsoft .NET Framework and Microsoft SQL Server is used as relational database system. Also, the Extensible Markup Language (XML) is used for storing data.

Keywords: Automated study planning, study planning, object-oriented programming, requirements specification, 3-tier architecture, database design, .NET, XML.

Resumé

Et studieplanlægningssystem har til formål at understøtte automatiseret studieplanlægning og derved hjælpe studerende med at udarbejde en plan for deres studieforløb. På nuværende tidspunkt er det en nærmest uoverkommelig opgave for den enkelte studerende at planlægge sit studieforløb mere end blot et par semestre frem og et værktøj til at understøtte studieplanlægning er således stærkt påkrævet.

I denne afhandling analyseres domænet for studieplanlægning ud fra en studerendes synsvinkel med udgangspunkt i Danmarks Tekniske Universitet. Analysen udføres ved hjælp af Unified Modelling Language-klassediagrammer (UML-klassediagrammer) og omhyggelige beskrivelser. En kravspecifikation udarbejdes indeholdende krav til data, funktionalitet og kvalitet. I tillæg hertil angives en række andre krav f.eks. lovgivningsmæssige krav.

På grundlag af kravspecifikationen implementeres et fuldt fungerende studieplanlægningssystem. Systemet er i høj grad konfigurerbart, understøtter forskellige kulturer og er baseret på en 3-lags arkitektur. Den benyttede udviklingsplatform er Microsoft .NET Frameworket og Microsoft SQL Server er anvendt som relationelt databasesystem. Ligeledes benyttes Extensible Markup Language (XML) til at lagre data.

Nøgleord: Automatiseret studieplanlægning, studieplanlægning, objekt-orienteret programmering, kravspecifikation, 3-lags arkitektur, databasedesign, .NET, XML.

Preface

The present Master's Thesis has been completed at the Department of Informatics and Mathematical Modelling (IMM) at the Technical University of Denmark (DTU) in the period from July 7, 2003 to December 19, 2003. Our M.Sc. studies are concluded by this project.

The project has been supervised by lektor Jens Thyge Kristensen and assoc. prof. Hans Bruun.

Acknowledgements

We would like to thank our supervisors for helpful guidance and for being obliging on enquiry. Special thanks to Jens Thyge Kristensen for several valuable proofreadings.

Also we would like to thank M.Sc. Torben Gjaldbæk, former co-student, for proofreading and profitable comments.

Chapter 1

Introduction

A study planning system is intended to support automated study planning helping students to elaborate a plan for their course of study. At the time being it is an overwhelming task for the individual student to plan his course of study more than just a couple of terms ahead and a tool for supporting study planning is thus urgently needed.

The aim of a study planning system is to make students plan in the long view, highlight substance instead of rules and constraints, give rise to a plain leitmotif in the individual course of study and so on.

In this thesis we analyze the domain of study planning and prepare a requirements specification for a study planning system. Moreover, we implement a fully acting system which supports automated study planning.

1.1 Thesis Objectives

The objectives of the current thesis are:

1. To describe and profoundly analyze the domain of study planning.

2. To pose requirements to insist on if a study planning system is to support an expedient, automated study planning.

3. To implement a fully-fledged study planning system that meets the posed requirements.

1.2 Approach

We have used the following approach:

1. **Domain Description** (chapter 2)
   Initially, the different concepts and the coherence between these are described.

2. **Domain Analysis** (chapter 3)
   Then, we analyze the domain and present a logical model of the different entities and relations between the entities.

3. **Requirements Specification** (chapter 4)
   Starting from the domain analysis, we pose requirements to a study planning system.

4. **Implementation** (chapters 5, 6, 7 and 8)
   On the basis of the requirements specification we implement a study planning system.

5. **Testing** (chapter 9)
   Finally, the system is tested.

The domain analysis has been performed by applying an object-oriented approach using Unified Modelling Language[1] (UML) class diagrams as a means of representing the entities of the domain and the coherence between the entities.

The domain description, the domain analysis and the requirements specification (chapters 2, 3 and 4) are organized according to the principles expound in [5] and [18].

1.3 Previous Work

In the period from March 24, 2003 to June 23, 2003 we made a preparatory thesis (confer [15]) in which we analyzed the domain of study planning and determined which requirements to insist on if a study planning system is to support an expedient study planning.

We have based our work on [15] and large parts from this have been included in the current thesis. The sections 2.2-2.4 and 4.2-4.4 have been included from [15] in a by and large unaltered form while chapter 3 and section 4.1 are fundamental revisions of contents from [15].

1.4 Thesis Outline

In chapter 2, we describe the domain in both a concise and complete form. Chapter 3 provides an analysis of the domain. A requirements specification for the study planning system is presented in chapter 4. In chapter 5 the foundations of the study planning system are described. Chapter 6 forms an overview of select, central modules in the implemented system. In chapter 7, we describe how the system has been initialized with data and in chapter 8 the developed user interface is described. In chapter 10, we discuss whether the system fulfills the posed requirements. Chapter 11 presents some suggestions for future work to be done in continuation of this project. In chapter 12, we conclude on the project in general.

Appendix A gives an overview of the `StudyPlanning.DAL` namespace. Accordingly, appendix B provides an overview of the `StudyPlanning.Biz` namespace and appendix C provides an overview of `StudyPlanning.UI` namespace. Appendix D contains a decision diagram for the process of authentication. In appendix E diagrams of the database design are found. Volume

[1] Confer [4].

II contains the source code of the study planning system. Volume III contains code concerning the database.

1.5 Prerequisites

In order to read this thesis the following prerequisites are expected:

- Acquaintance with Unified Modelling Language (UML) class diagrams.
- Knowledge of object-oriented modelling and design.
- Basic knowledge of the Visual C# .NET programming language[2].
- Knowledge of database design and Structured Query Language (SQL).

1.6 Peculiarities

The notation "*&c.*" is used as an abbreviation of the Latin expression "et cetera".

[2] Alternatively, either Visual J# .NET or Java as both of these languages remind sufficiently of Visual C# .NET.

Part I

Domain Analysis & Requirements Specification

Chapter 2

Domain Description

In this chapter the domain of study planning will be described. First a synopsis is presented (section 2.1) in which the scope and span of the domain description are defined. Subsequently, a concise (section 2.2.1) and a more elaborate description (section 2.2.2) of the domain is presented along with the stakeholders of the domain (section 2.4). Finally, a terminology list (section 2.3) provides a quick overview of the concepts used in the domain.

2.1 Synopsis

This section defines the scope and span as they will be considered in this paper.

2.1.1 Scope

The domain covered in this paper is that of study planning.

2.1.2 Span

The domain will be considered from a student's point of view. The process of study planning will be covered extensively as this is an important part of the domain. Other entities in the domain such as the university, departments, lecturers, courses, periods *&c.* will also be covered.

Focus is on the process of study planning and therefore some details which are of no importance in relation hereto have been omitted. For example one might want to register some information about lecturers, e.g. interests, projects, publications *&c.* However, this information has no influence whatsoever on the process of study planning and hence it has been left out in the span of this paper.

It has been attempted to make the descriptions as general as possible. However, as the requirements specification later in this paper presents the requirements for a study planning system which is intended to be implemented at the Technical University of Denmark (DTU), many of the examples and descriptions in the paper relate specifically to the concepts and structures of educations used at DTU.

Many types of students study at DTU. Some examples of student types are given below:

- Bachelor of Science (B.Sc.) students.
- Master of Science (M.Sc.) students.
- Foreign M.Sc. students.
- Ph.D. students.
- Food Science students.

For reasons of demarcation only B.Sc. and M.Sc. students will be included in the domain description.

2.2 The Domain of Study Planning

In this section the domain of study planning is described in a concise and a more complete way.

2.2.1 Concise Description

Study planning is an iterative process of selecting courses from a set of required courses and a set of optional courses and arranging them by timetable module in a timetable for one period at a time. Alongside the courses a number of projects must also be scheduled at certain points in the course of study.

Some courses require knowledge which may be obtained in another course thus introducing a dependency in the creation of the study plan. The prerequisites for a course may be mandatory, technical or desirable. Mandatory prerequisites must inevitably be satisfied, however, students may choose to ignore other prerequisites and sign up for a course anyway.

Some courses are mutually exclusive – also known as point blocking – if they have similar contents and hence only one of these courses should be selected.

Both Bachelor of Science (B.Sc.) and Master of Science (M.Sc.) students must choose a technical package containing a selection of mandatory courses. Moreover, M.Sc. students may aim at obtaining a technical line or a specialization within a given field.

When setting up a study plan the various constraints imposed by the university or legislation must be taken into account as well as the criteria determined by the student.

Examples of constraints and criteria:

1. M.Sc. students must achieve a total amount of 300 points and 15 points hereof must be obtained from courses giving AMS points in order to receive their master's degree. B.Sc. students must achieve a total amount of 210 points to receive their degree.
2. A minimum number of points must be achieved every year in order to maintain student grant.
3. No courses should be scheduled on Tuesday afternoons for the spring period of the year 2003.

Constraint number one is an example of a constraint imposed by the university. The second constraint is imposed by the State Education Fund and the third is a criterion posed by the student.

2.2.2 Complete Description

In this section we shall analyze the descriptions from section 2.2.1 in order to classify, categorize and describe the concepts mentioned herein. In addition, the description is extended with further concepts.

The most significant part of the domain is the *student*. Without students there would be no need for study planning.

A university consists of a number of *departments* which are small independent units with the responsibility of teaching and conducting research within a well-defined field of science, the Humanities, social studies *&c.* – e.g. "Mathematics" or "Manufacturing Engineering and Management".

Students study at a *university*.

Departments offer a number of *courses* and *projects*. A course is the teaching of one or more topics from the field of science of the department for a given period of time. At the end of the period the course is evaluated and the students may either pass or fail the course. A project is the writing of a paper based on an assignment possibly including the solving of a practical exercise. Courses with no timetabled teaching are also regarded as projects as well the trainee job which B.Sc. students must complete at a company.

Passing a course or a project gives the students a number of credit *points* depending on the estimated workload required to pass the course or project.

Courses are taught by *lecturers* who are affiliated with a department at the university. "Lecturers" is a common designation of lecturers, senior lecturers and professors.

Both B.Sc. and M.Sc. students must choose a *technical package* which is a selection of mandatory courses and projects which will give the student a fundamental knowledge of the chosen field of science.

M.Sc. students may choose to obtain a *technical line* which is a specialization within a given field acquired by gathering a certain amount of credit points from passing select courses. Having chosen a technical line, M.Sc. students have the option of following a *specialization* which is a recommended course of study within the chosen technical line.

A course is taught in one or more *timetable modules* in a weekly recurring timetable. A timetable module is the designation of a given period of time on a specific weekday e.g. Mondays from 8:00 to noon is designated the module 1A (figure 2.1 below).

A *timetable* is comprised of all the possible timetable modules.

Time	**Mon**	**Tue**	**Wed**	**Thu**	**Fri**
8.00 – 12.00	1A	3A	5A	2B	4B
12.00 – 13.00	Break	Break	Break	Break	Break
13.00 – 17.00	2A	4A	5B	1B	3B

Figure 2.1: Example of a timetable from DTU showing the timetable modules.

A *Period* is a subdivision of a calendar year specified by a start date and an end date e.g. from February 3rd 2003 to May 13th 2003. There may be different types of periods and periods of varying length.

B.Sc. students must conclude their studies by writing a *Bachelor's Thesis* which is a project with a duration of approximately 5 months. Likewise, M.Sc. students must also conclude their studies by writing a *Master's Thesis* which is a project spanning a period of 5 to 12 months.

Producing a *Study Plan* is the rather involved, iterative process of scheduling courses in timetables for the remaining periods of a student's course of study. Alongside the courses some projects must also be scheduled. The student's interests, technical package, desired technical line, interdependencies between courses, courses and projects which have already been finished as well as the general recommendations from the university as when a given course should ideally be scheduled must be taken into account.

2.3 Terminology

Below we have listed in alphabetical order a brief overview of some important concepts and their meaning from the domain description.

AMS
: is an abbreviation of the Danish words "Arbejdsmiljø, Miljø og Samfundsfag" – in English work environment, environment and civics.

Bachelor of Science (B.Sc.)
: is the title acquired by a person who has studied for 3-3$\frac{1}{2}$ years at a university.

Bachelor's Thesis
: is the project which concludes the studies of a B.Sc. student.

Course
: is the timetabled teaching of select topics within a specific field of science, the Humanities, social studies *&c.*

Department
: is a subdivision of a university with the responsibility of teaching and researching within a specific field of science, the Humanities, social studies *&c.*

ECTS
: is an abbreviation of "European Credit Transfer System" – a unit of measurement used by European universities to denote the amount of credit points which may be obtained by passing a course.

Lecturer
: is a person who teaches one or more courses at a university.

Master of Science (M.Sc.)
: is the title acquired by a person who has studied for at least 5 years at a university.

Master's Thesis
: is the project which concludes the studies of a M.Sc. student.

Module
: is a weekly recurring time interval in which a course is taught.

Point
: is used as a way of expressing the estimated workload required to pass a course.

Project
: is the writing of a paper based on a given assignment, a course with no timetabled teaching or a trainee job in a company.

Specialization
: is a recommended course of study within a given technical line.

Student
: is a person who studies at a university.

Study Plan
: is a collection of courses and projects scheduled for the remaining part of the student's course of study.

Technical Line
: is a specialization within a given field which – if completed – will appear on the student's diploma.

Technical Package
: is a selection of mandatory courses which provide a fundamental knowledge of a given field of science.

University
: is an institution that teaches and performs research within the areas of the Humanities, social studies, natural science *&c.*

2.4 Stakeholders

In this section the various stakeholders in the domain of study planning are briefly described.

According to [5], section 15.3.2, stakeholders are:

> "A closely knit, tightly related group of either people or institutions, pressure groups where the 'fabric' that 'relates' members of the group, 'separates' these from other such stakeholder groups, and from non-stakeholder entities."

The stakeholders of the study planning domain are:

The *students* who study at the university.
The *lecturers* who teach courses at the university.
The *university* as a whole.
The individual *departments* at the university.

Chapter 3

Domain Analysis

In this chapter we present analysis of the domain of study planning. As mentioned in section 1.2, the domain analysis has been performed by applying an object-oriented approach using UML class diagrams as a means of representing a logical model of the domain. Consequently, entities in the domain are referred to as classes and relations between entities are referred to as associations.

For reasons of space and clarity, the logical model is divided up into several figures and hence some classes occur in more than one figure. Each class is named uniquely and in singular. A class with the same name in two different figures thus represents one and the same class.

The individual class and its associations to other classes is meticulously described and explained on the philosophy that however unequivocal a diagram may be it is of small value if the very meaning hereof is not plain.

The headings in this chapter correspond to the names of the various classes by which it is convenient to look up classes in the table of contents.

3.1 Department

Each department of the university is a larger, independent unit which is responsible of teaching and doing research within a number of subjects or areas[1]. A department is represented by the class `Department`.

As it appears from figure 3.1 one or more lecturers may be attached to a department. The attached lecturers are the ones who among other things are responsible of lecturing and coaching in the courses offered by the department.

Also a number of students are possibly attached to the department in the form of an association between the `Department` and `Student` (section 3.5) classes. Far from all students are attached to a department as a student is only attached to a department when he is writing his master or bachelor thesis.

[1] http://www.adm.dtu.dk/institutter/index_d.htm,
http://www.adm.dtu.dk/fakta/rekrut/profiltxt_d.htm,
http://www.adm.dtu.dk/fakta/adm/l_sek/vedtaegt_d.htm (§§18)

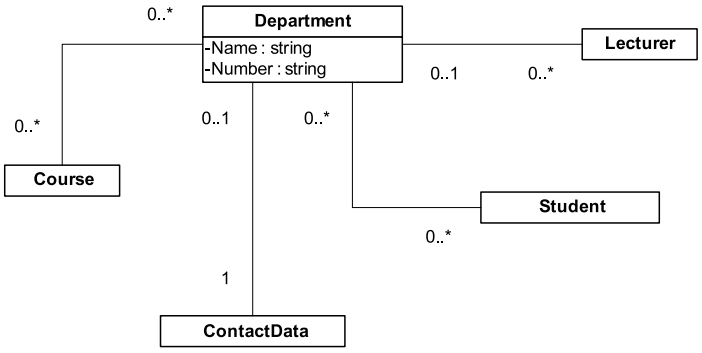

Figure 3.1: Logical model of the `Department` class and its associations to the `Course`, `ContactData`, `Student` and `Lecturer` classes.

The department's address and other contact information are represented by an association to the `ContactData` (section 3.12) class.

A department may offer one or more courses. The contents of the courses offered by the department are directly related to the areas within which the department carries out research.

The `Department` class has the following attributes:

Attribute Name	Description
Name	Name of the department.
Number	The internal number of the department.

3.2 Lecturer

In this context "lecturer" has been selected as a common designation of lecturer, senior lecturer and professor.

The lecturer is a person who is employed by the university with the purpose of teaching courses among other things. A lecturer may also be responsible for conducting research, writing publications and holding seminars. In the domain of study planning, however, only the lecturer's role as a teacher is relevant.

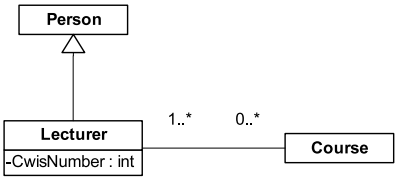

Figure 3.2: Logical model of the `Lecturer` class and its association to the `Course` class as well as the generalization from the `Lecturer` class to the `Person` class.

A lecturer is a person as denoted by the generalization between the `Lecturer` class and the `Person` class (section 3.11).

A lecturer may teach one or more courses and a course may be taught by more than one lecturer.

The `Lecturer` class has the following attribute:

Attribute Name	Description
CwisNumber	The Campus Wide Information System[2] number of the lecturer.

3.3 Course

A course is the timetabled teaching of various topics within a given field of education for a predefined period of time[3]. At the end of the period the attending students are evaluated and may either pass or fail the course. Passing a course gives the student a certain amount of credit points[4].

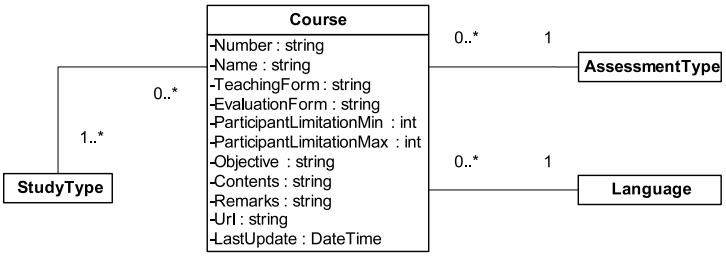

Figure 3.3: Logical model of the `Course` class and its associations to the `StudyType`, `Language` and `AssessmentType` classes.

The `Course` class (figure 3.3 represents a course. Each `Course` object (figure 3.3) is linked to one or more `StudyType` (section 3.8) objects which describe the study types for which the course is intended. The association between the `Course` and `Language` (section 3.19) classes represents the language in which the course is taught. Courses are assessed in exactly one way illustrated by the association between the `Course` and the `AssessmentType` (section 3.17) class.

The `Course` class has the following attributes:

Attribute Name	Description
Number	A unique identification of the course which may contain characters – e.g. “C4222” or “88890”.
Name	The name of the course.
TeachingForm	Text describing how the course is taught e.g. “group discussions”, “lectures” or “laboratory exercises”.
EvaluationForm	Description of how the course is evaluated e.g. “Reports count 60% and the written exam 40%” or “One report with oral defence”.

[2] http://www.adm.dtu.dk/fakta/om_cwis/index_e.htm
[3] http://www.kurser.dtu.dk
[4] http://www.adm.dtu.dk/studier/bekendt/bekend_d.htm
A template for a course description can be found in [11]

Attribute Name	Description
ParticipantLimitationMin	The minimum number of students who must sign up for the course in order for the course to be completed.
ParticipantLimitationMax	The maximum number of students who can attend the course simultaneously.
Objective	A description of the course objective i.e. what the student will achieve by passing the course.
Contents	Text describing the contents of the course i.e. an excerpt of the syllabus for the course.
Remarks	Special remarks regarding the course.
Url	The url for the course home page where further information can be retrieved.
LastUpdate	Date and time for the last update of the course description.

3.3.1 Course Parts

Some courses span several periods and must thus be divided into sequent parts in order to avoid ambiguity and to state exactly which part of the course belongs to which period. Each part of a multi-part course must be signed up for in ascending order and successive parts must be finished in the first possible periods where the course part is taught as shown in figure 3.4. Figure 3.5 shows a scenario which may not be allowed – even though part 2 of the course is taught in periods b and d it is considered another instance of the course part in period d.

Period	*a*	*b*	*c*	*d*	...
Part	1	2			

Figure 3.4: Allowed scenario – course parts must be finished in the first possible period.

Period	*a*	*b*	*c*	*d*	...
Part	1			2	

Figure 3.5: Disallowed scenario – unless part 2 is not taught in periods b and c.

The `CoursePart` class represents a part of a course and a course consists of one or more sequentially numbered course parts depicted by the association between the `Course` and `CoursePart` classes shown in figure 3.6.

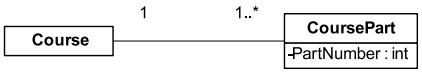

Figure 3.6: Logical model of the associations between the `Course` and `CoursePart` classes.

The `CoursePart` class has the following attribute:

Attribute Name	Description
PartNumber	The number of the course part.

3.3.2 Periods and Credit Points

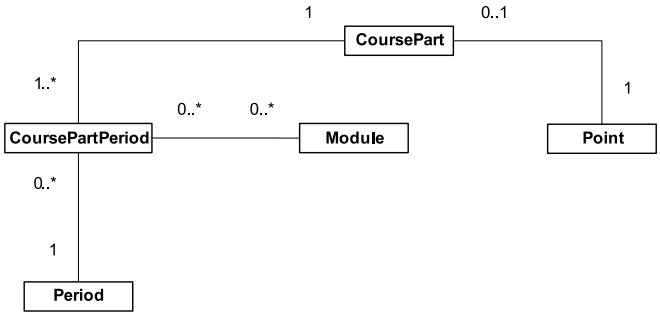

Figure 3.7: Logical model of the associations between the `CoursePart` class and the `CoursePartPeriod`, `Period`, `Module` and `Point` classes.

The total number of credit points which is obtained by passing a course is distributed among the course parts. The credit points for each course part are described by the association between the `CoursePart` and `Point` (section 3.13) classes (figure 3.7). To preserve the rule illustrated in figure 3.4 each course part must be associated with the periods in which it is taught. This association is shown in figure 3.7.

A `CoursePartPeriod` object may be associated with one or more `Module` (section 3.15) objects which correspond to the timetable modules in which the course part is taught.

3.3.3 Modules

The timetable schedule of courses may be specified in a compound form as shown in the next example:

For course `28010` the modules are specified as[5]:

```
E5A and F5A
```

Here *E* means autumn (Danish: efterår) and *F* stands for spring (Danish: forår). *5A* is the module in which the course is taught, Wednesdays from 8:00 to 12:00. So according to this the course consists of two parts, the first part is taught in the autumn and the second part is taught in spring. However, the course description says that the course only spans one teaching period and as the course only gives the student 5 credit points the author probably meant:

```
E5A or F5A
```

Another example is course `28011` which has the following specification of modules[6]:

```
E3A and E5A and January
    or F2B and June
```

From this it appears that the course consists of two parts – the student may take the first part either in the autumn in the modules *3A* and *5A* or in spring in module *2B*. The corresponding second parts of the course are taught in January and June, respectively. The course description confirms this interpretation.

[5] http://www.kurser.dtu.dk/presentation/presentation.asp?coursecode=28010-2
[6] http://www.kurser.dtu.dk/presentation/presentation.asp?coursecode=28011-2

The module specification for course `28010` corresponds to the general specification in figure 3.8 where $\mathcal{M}$ is the set of available modules.

$$\left.\begin{array}{l}(a_1 \vee b_1 \vee \ldots \vee z_1)\\ \wedge\\ (a_2 \vee b_2 \vee \ldots \vee z_2)\\ \wedge\\ \ldots\end{array}\right\} a, b \ldots z \in \mathcal{M}$$

Figure 3.8: Most common module specification.

Whereas the module specification for course `28011` has the form shown in figure 3.9.

$$\left.\begin{array}{l}(a_1 \wedge b_1 \wedge \ldots \wedge z_1)\\ \vee\\ (a_2 \wedge b_2 \wedge \ldots \wedge z_2)\\ \vee\\ \ldots\end{array}\right\} a, b \ldots z \in \mathcal{M}$$

Figure 3.9: Less common module specification.

3.3.4 Course interdependencies

A course may have relations to other courses and the following four types of interdependencies have been identified:

- Mandatory prerequisite courses
- Technical prerequisite courses
- Desirable prerequisite courses
- Point blocking courses

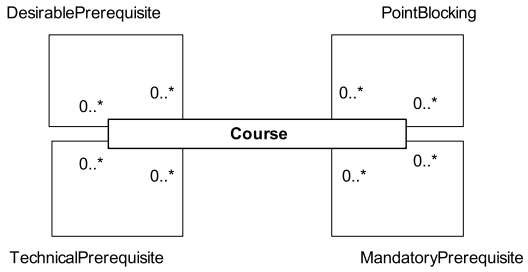

Figure 3.10: Logical model of the four associations from the `Course` class to itself.

The `Course` class has four associations to itself describing the possible interdependencies between courses (figure 3.10). A course may have none or many of the four types of interdependencies.

For course `27031` the technical prerequisites are:

```
27000 / 27001.28120 (if possible at the same time). Mega MAT
```

The / operator should be interpreted as logical *or* and the . (dot) operator means logical *and* in this context[7]. Logically this expression is unambiguous since *and* takes precedence over *or*[8] and bearing in mind that "Mega MAT" has course number `01005` the expression could also be written as:

$$\texttt{27000} \lor (\texttt{27001} \land \texttt{28120} \land \texttt{01005})$$

Judging by the contents of the courses, however, this is most likely not what the author intended as the courses `27000` and `27001` are equivalent and the courses `28120` and `01005` are completely different. What the author actually meant is probably:

$$(\texttt{27000} \lor \texttt{27001}) \land \texttt{28120} \land \texttt{01005}$$

This raises the question of whether to read the expression using the precedence of logical operators in boolean logic or in a left–to–right fashion.

Nonetheless, mandatory prerequisites, desirable prerequisites and point blocking courses are specified in the same way which leads to the general specification of interdependencies between courses shown in figure 3.11 where $\mathcal{C}$ is the set of courses.

$$\left.\begin{array}{l} (a_1 \lor b_1 \lor \ldots \lor z_1) \\ \land \\ (a_2 \lor b_2 \lor \ldots \lor z_2) \\ \land \\ \ldots \end{array}\right\} a, b \ldots z \in \mathcal{C}$$

Figure 3.11: Most commonly used course dependency specification.

The specification in figure 3.11 is used for the vast majority of courses, however, a few courses use a different specification. For instance course `31652` for which the technical prerequisites are described as[9]:

```
(31029.31657)/(01032.41621)
```

This may also be written as:

$$(\texttt{31029} \land \texttt{31657}) \lor (\texttt{01032} \land \texttt{41621})$$

Generally this can be written as the expression shown in figure 3.12.

In order to sign up for a course its mandatory prerequisites must be satisfied – i.e. any mandatory prerequisite courses must have been passed. Mandatory courses are typically

[7] Confer ([11])
[8] Confer ([24])
[9] http://www.kurser.dtu.dk/presentation/presentation.asp?coursecode=31652-2

$$\left.\begin{array}{l}(a_1 \wedge b_1 \wedge \ldots \wedge z_1)\\ \vee\\ (a_2 \wedge b_2 \wedge \ldots \wedge z_2)\\ \vee\\ \ldots\end{array}\right\} a, b \ldots z \in \mathcal{C}$$

Figure 3.12: Sparsely used course dependency specification.

safety related – e.g. prior to working with high voltages or hazardous chemicals a mandatory safety course must be taken.

Technical prerequisite courses are not mandatory, but they do provide some knowledge which the students are assumed to be familiar with prior to signing up for a course. Technical prerequisites may also be specified as qualifications – e.g. for course `02393` the technical prerequisites are described as "Knowledge of basic programming concepts as datatypes, choices and decisions, loops and functions".

Desirable prerequisite courses contain useful knowledge which might be relevant, however, they are neither mandatory nor do they give any competence required to sign up for a course. Desirable prerequisites may too be defined as qualifications – e.g. the desirable prerequisites for course `28252` are "Mathematical and Process technology background".

A course is point blocking in relation to another course if the contents of the two are mostly alike and while a student is allowed to sign up for both courses, only the first one passed will give the student any credit points. Often a course is point blocking in combination with earlier/later versions of the same course so students cannot just easily collect a lot of credit points by taking similar courses. One might also say that a course and its point blocking courses are mutually exclusive with regards to credit points.

$$(A \overset{p}{\bowtie} C) \wedge (B \overset{p}{\bowtie} C) \nRightarrow (A \overset{p}{\bowtie} B)$$

Figure 3.13: Transitivity between point blocking courses may not be assumed.

Figure 3.13 illustrates that if a course A is point blocking in relation to (denoted by the $\overset{p}{\bowtie}$ operator) a course C and another course B is also point blocking in relation to the course C then the courses A and B are often mutually point blocking as well, however, this transitivity does not always hold.

3.3.5 Recommended Placement

As it appears from figure 3.14 courses may have a recommended placement – i.e. at which point in the course of study a course should ideally be taken. The recommended placement may be specified separately for individual study types either specifically like:

> Bachelor of Science: "4th to 5th semester"
> Master of Science: "2nd to 3rd semester"

or as a concept like:

> Bachelor of Science: “At the end of the study”
> Master of Science: “In the middle of the study”

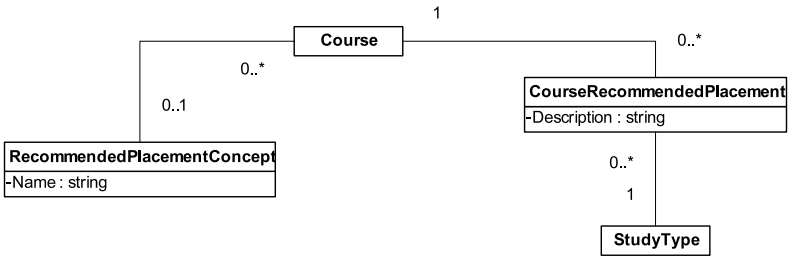

Figure 3.14: Logical model of the association between the `Course`, `RecommendedPlacementConcept`, `CourseRecommendedPlacement` and `StudyType` classes.

The `RecommendedPlacementConcept` class represents the possible concepts of placement recommendations – e.g. “The middle of the study” or “At the end of the study” .

The `RecommendedPlacementConcept` class has the following attribute:

Attribute Name	Description
Name	The name of the concept – e.g. “The middle of the study”.

The `CourseRecommendedPlacement` class has the following attribute:

Attribute Name	Description
Description	Description of the recommended placement of the course in relation to a given study type – e.g. “B.Sc.: 3rd semester” and “M.Sc.: 2nd semester”.

3.3.6 Miscellaneous

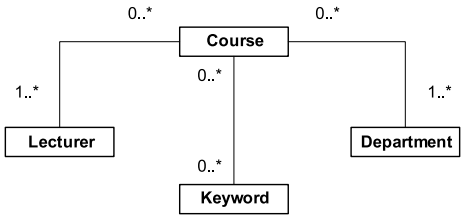

Figure 3.15: Logical model of the association between the `Course` class and the `Lecturer`, `Keyword` and `Department` classes.

Figure 3.15 reflects that each course may have one or more keywords (section 3.10) associated with it. These keywords are selected by the author to describe the contents of the course. A course has one or more contact persons (lecturers) who are usually also the persons who teach the course. Commonly, a course is offered by a specific department, however, some courses are offered through a collaboration between multiple departments.

3.4 Project

A project is a work of more or less extensive character executed within some period having no timetabled teaching[10]. The actual project work is carried out by one or several students in collaboration.

Examples of projects that students have to prepare are given in section 3.5. Notice, some projects are regarded as courses in that timetabled teaching is offered in addition to the project work[11].

A project is represented by the `Project` class (figure 3.16).

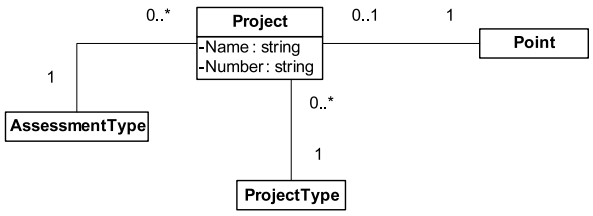

Figure 3.16: Logical model of the `Project` class and its associations to the `AssessmentType`, `ProjectType` and `Point` classes.

A project is of some type and so each `Project` object is linked to a `ProjectType` object (confer subsection below). The workload of a project is measured by means of points and an association thus exists between the `Project` and `Point` (section 3.13) classes.

The outcome of a project may be assessed in different ways e.g. by a grade or pass/fail. This is represented by the association to the `AssessmentType` class (section 3.17).

The `Project` class has the following attributes:

Attribute Name	Description
Name	Name of the project.
Number	A number that identifies the project. The project number may contain characters and is therefore modelled as a string.

According to figure 3.17, a project may be executed by just one student or as a collaboration between several students as expressed by the association between the `Project` class and the `StudentProject` (section 3.5) class.

The fact that a project spans some period is manifested in figure 3.17 by the association between the `Project` class and the `Period` (section 3.14) class. Projects being part of one or more technical packages are not directly associated to a period as the project period is individually specified for each of the relevant technical packages[12].

3.4.1 ProjectType

The `ProjectType` class represents the possible types of projects (figure 3.18).

[10] http://www.adm.dtu.dk/studier/bekendt

[11] As an example technical package projects (projects that must be completed as part of a technical package) are regarded as courses in that teaching in subjects like “collaboration”, “formulation of abstract” and “delimitation” is timetabled during the project work.

[12] Confer section 3.6 for a detailed description of the association between projects and technical packages.

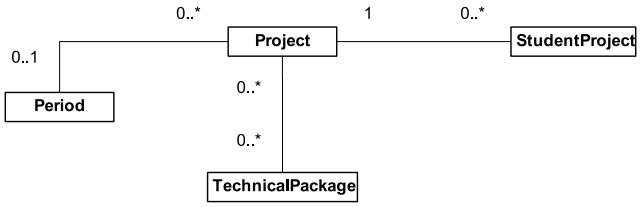

Figure 3.17: Logical model of the associations between the `Project` class and the `StudentProject`, `Period` and `TechnicalPackage` classes.

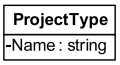

Figure 3.18: Logical model of the `ProjectType` class.

The `ProjectType` class has the following attribute:

Attribute Name	Description
Name	The name of the project type – e.g. "Mid-way Project".

3.5 Student

A student is a person who studies at the university. The individual student may obtain a degree by passing a set of courses and finishing a number of projects.

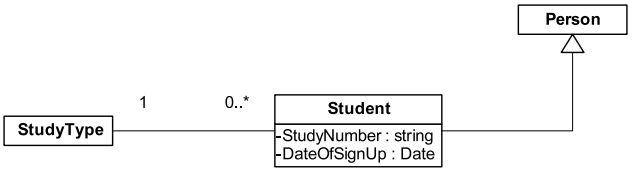

Figure 3.19: Logical model of the `Student` class and its generalization to the `Person` class. Moreover, the association between the `Student` class and the `StudyType` class.

As already mentioned a student is a person. In figure 3.19, that fact is denoted by the generalization between the `Student` class and the `Person` (section 3.11) class.

Every student takes a degree of some type[13] e.g. "Bachelor of Science". In figure 3.19 this is expressed by an association between the `Student` and `StudyType` (section 3.8) classes.

The `Student` class has the following attributes:

[13] http://www.explore.dtu.dk/retning/sr.html

Attribute Name	Description
StudyNumber	A number which uniquely identifies the student. The study number is assigned when the student is signed up at the university. A study number may contain characters like e.g. "s971838" and is therefore a string.
DateOfSignUp	The date at which the student signed up at the university.

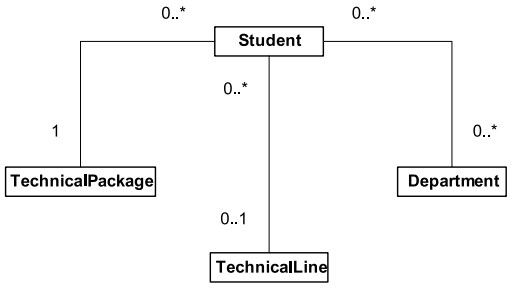

Figure 3.20: Logical model of the association between the `Student` class and the `TechnicalPackage`, `TechnicalLine` and `Department` classes.

A student may be attached to one or more departments (figure 3.20) when he is writing his master's or bachelor's thesis. That is, not all students are attached to a department.

Every student first of all has to complete a technical package[14] (section 3.6). Students may select between various technical packages, however, it is only allowed for a student to complete one technical package.

M.Sc. students have the option to complete a technical line (section 3.7).

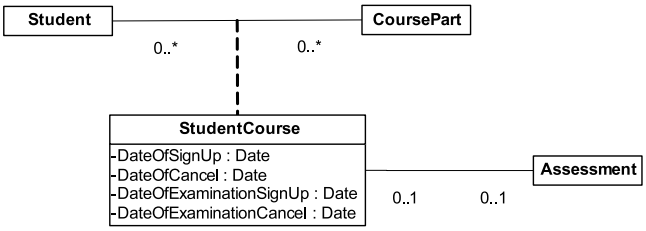

Figure 3.21: Logical model of the association between the `Student` and `Course` classes. As well a logical model of the association class `StudentCourse` and its association to the `Assessment` class.

Every student can sign up for one or more courses (figure 3.21). A sign up may be cancelled by the student later on. A student can finish a course he has signed up for either by getting a "Pass" or a grade of 6 or higher depending on the way whereupon the course is assessed. Hence, a course is not finished (and points therefore not credited) if the student obtains a "Fail" or a grade less than 6. The result obtained by the student in a given course finds expression by the association between the `StudentCourse` class and the `Assessment` (section 3.16) class.

[14] http://www.explore.dtu.dk/studie/civ/uddyb.html

If a student has unsuccessfully attempted to finish a given course he may sign up for that course again, however, rules apply with respect to the permissible number of repeater attempts[15].

The `StudentCourse` class has the following attributes:

Attribute Name	Description
DateOfSignUp	The date at which the student signed up for the course.
DateOfCancellation	The date at which the student has cancelled his previous sign up for the course.
DateOfExaminationSignUp	The date at which the student signed up for examination in the course.
DateOfExaminationCancellation	The date at which the student has cancelled his previous sign up for examination in the course.

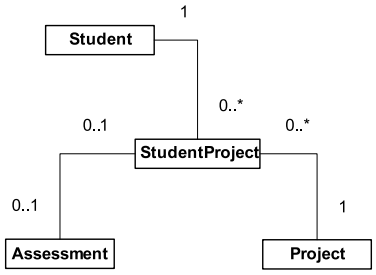

Figure 3.22: Logical model of the association between the `Student` and `StudentProject` classes. As well a logical model of the associations from the `StudentProject` class to the `Project` and `Assessment` classes.

A student has to prepare one or more projects during his study[16] (figure 3.22). As an example Master of Science students have to prepare a so-called "Mid-way Project" in the middle of their study. Similarly, Bachelor of Science students are under the obligation to complete a trainee job at a company. It is worthy of note that a trainee job is considered a project.

Both Bachelor and Master of Science students are supposed to finalize their studies by preparing a bachelor's or a master's thesis, respectively. A thesis is also considered a project.

The assessment of a project is represented by an association between the `StudentProject` and the `Assessment` classes.

Figure 3.23: Logical model of the association between the `Student` class and the `StudyPlan` class.

Each student can have one or more study plans (figure 3.23) representing different course of study scenarios considered by the student.

[15] [10], page 171, item 5.
[16] [10], pages 202 and 210.

3.6 TechnicalPackage

A technical package[17] is the name of a set of courses and projects which both Master and Bachelor of Science students have to finish in order to fulfil one among other requirements[18].

The `TechnicalPackage` class represents a technical package.

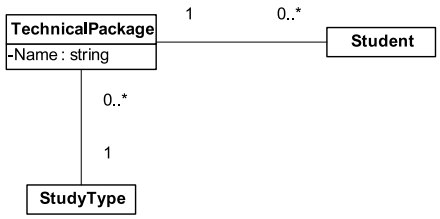

Figure 3.24: Logical model of the `TechnicalPackage` class and its association to the `Student` class and the `StudyType` class.

A technical package may be completed by one or more students and is directed to one particular study type (figure 3.24).

The `TechnicalPackage` class has the following attribute:

Attribute Name	Description
Name	The name of the technical package.

According to figure 3.25 every `TechnicalPackage` object is linked to one or more objects of type `TechnicalPackagePeriod` (confer subsection below). In other words a technical package consists of one or more periods and these periods are furthermore composed of a number of courses.

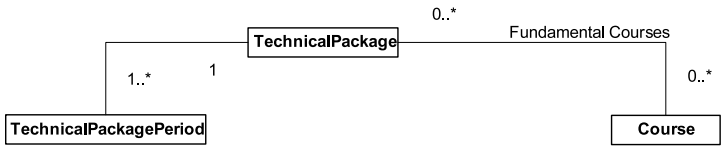

Figure 3.25: Logical model of the associations between the `TechnicalPackage` class and the `TechnicalPackagePeriod` and `Course` classes.

Moreover, a technical package may consist of one or more so-called fundamental courses which are basically just courses. The reason why those courses are named "fundamental" is merely due to the very contents hereof.

The fundamental courses are for some technical packages specified in the form illustrated by figure 3.11 on page 18 i.e. in the same way as course interdependencies are most commonly specified.

[17] Notice, in this context "technical package" has been chosen as a common designation of the Danish terms "fagpakke" and "retning". Master of Science students have to complete a "fagpakke" and Bachelor of Science students have to complete a "retning", however, it is obvious to operate only with one concept as the two afore-mentioned terms cover the same – namely a specification of courses and projects.

[18] http://www.adm.dtu.dk/studieinformation/studinfo/fagpakkeskema/index_d.htm, http://www.diploming.dtu.dk

3.6.1 TechnicalPackagePeriod

As previously mentioned a technical package consists of one or more periods of type `TechnicalPackagePeriod`. Each period of a technical package is further made up of different components.

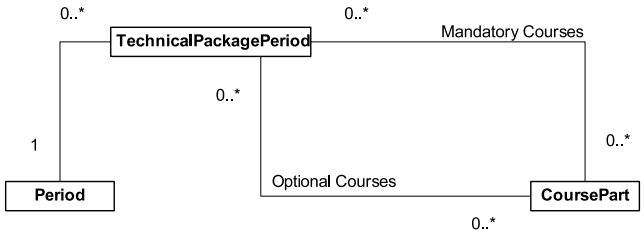

Figure 3.26: Logical model of the `TechnicalPackagePeriod` class and its associations to the `Period`, `CoursePart` classes.

First and foremost it is worth to notice that according to figure 3.26 each `TechnicalPackagePeriod` object is linked to exactly one `Period` object (section 3.25).

Each period of a technical package has a number of mandatory courses specified (the *Mandatory Courses* association) which students taking the current technical package have to follow in the concerned period. Mandatory courses are – as was the case with fundamental courses expound previously in this section – specified in the form illustrated by figure 3.11 on page 18.

The association labelled *Optional Courses* in figure 3.26 indicates a number of courses which it may be appropriate for students taking the current technical package to follow in the concerned period.

3.6.2 TechnicalPackageProject

A technical package may in addition to the mandatory courses specify a number of projects that students have to complete as part of the technical package.

A project of a technical package is represented by the `TechnicalPackageProject` class.

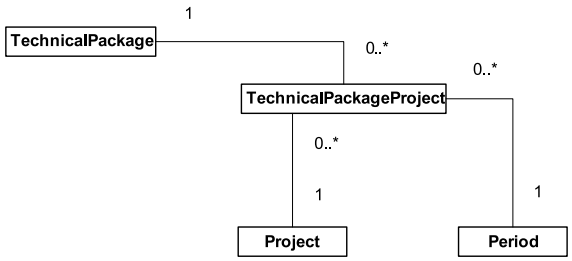

Figure 3.27: Logical model of the association between the `TechnicalPackageProject` class. Moreover, a logical model of the associations between the `TechnicalPackageProject` class and the `Project` and `Period` classes.

Each project of the technical package must be executed in a specific period as reproduced by the association between the `TechnicalPackageProject` class and the `Period` class (figure 3.27). A project can be part of several technical package specifications.

3.7 TechnicalLine

A technical line is a recommended course of study within a given field which makes it possible for Master of Science students to obtain a comprehensive competence within this field[19].

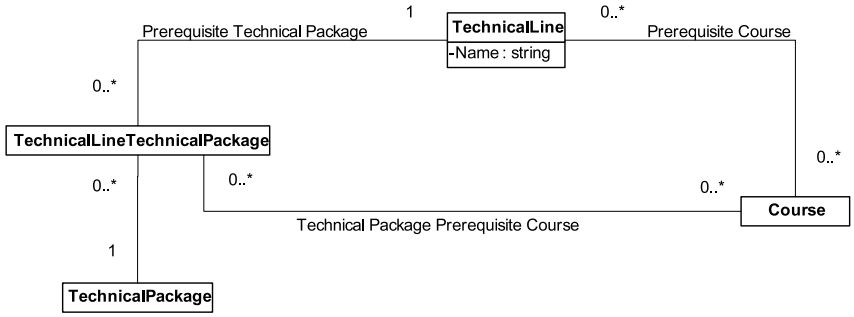

Figure 3.28: Logical model of the `TechnicalLine` class and its associations to the `TechnicalPackage` and `Course` classes as well as the `TechnicalLine-TechnicalPackage` class.

In order to commence a technical line, a specific prerequisite technical package may be required – shown as the *Prerequisite Technical Package* association in figure 3.28. In addition to a technical package a number of entrance requirement courses may be specified for each technical package – depicted as the *Technical Package Prerequisite Course* association in figure 3.28. For example the technical line "Informatics" has the following two possible entrance requirements[20]:

- The "Informatics" technical package and the courses `02130` and `02140`.
- The "Electrical Engineering" technical package and the courses `02130`, `02140`, `02100`, `02105` and `02110`.

Furthermore a number of entrance courses which apply to all students regardless of technical package may be specified. This condition is represented by the *Prerequisite Course* association in figure 3.28.

The `TechnicalLine` class has the following attribute:

Attribute Name	Description
Name	The name of the technical line – e.g. "Energy" or "Construction".

Each technical line (figure 3.29) is divided into one or more subdivisions known as technical fields (section 3.7.1). Furthermore, a technical line is divided into one or more specializations (section 3.7.2) which are analogous and sometimes identical to the technical fields.

To complete a technical line a certain number of credit points must be collected from the technical fields or specializations of the technical line. The association between the `TechnicalLine` and `Point` classes constitutes this requirement.

[19] http://www.adm.dtu.dk/studier/bekendt/civord01_d.html#4.%20Retningsbetegnelse
[20] http://www.adm.dtu.dk/studier/retninger/informatik_d.htm

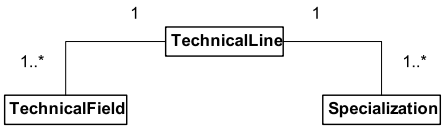

Figure 3.29: Logical model of the association between the `TechnicalLine` and `TechnicalField` classes as well as the association between the `TechnicalLine` and `Specialization` classes.

Figure 3.30: Logical model of the association between the `TechnicalLine` and `Point` classes.

3.7.1 TechnicalField

As earlier mentioned a technical field is a subdivision of a technical line – a grouping of related courses. For example within the technical line "Energy" there is a technical field called "Renewable Energy Sources"[21]. The technical field consists of a list of courses from which a certain amount of credit points must be collected. A technical field is represented by the `TechnicalField` class (figure 3.31). A course may be part of one or more technical fields.

Figure 3.31: Logical model of the `TechnicalField` class and its association to the `Course` class.

The `TechnicalField` class has the following attribute:

Attribute Name	Description
Name	The name of the technical field.

3.7.2 Specialization

A specialization is an area within a technical line in which a student may choose to specialize – a recommended course of study. The specialization consists of a list of courses which may be either main or supplementary, point giving or non-point giving (figure 3.32). Main courses are the primary courses of the specialization and thus the student should first of all select courses which are categorized as main courses. Besides the main courses the student may also select a number of supplementary courses which are secondary to the main courses. A course may be point giving which means that the credit points obtained by passing the course are included in the point requirement for the technical line. Analogously, the points obtained from non-point giving courses are not included.

The required amount of credit points for the technical line must be obtained from either main or supplementary courses which are point giving.

The specializations of the technical line "Applied Chemistry and Chemical Engineering" differ from all other specializations by being further divided into subcategories called "fundamental

[21] http://www.adm.dtu.dk/studier/retninger/energi_d.htm

courses", "affiliated courses" and "other courses" each with a point requirement. The descriptions are somewhat equivocal – e.g. the subcategory "other courses" for the specialization "Chemical Product Development"[22] is described as "At least two courses distributed over the technical fields 2 and 4." However, this is rather unclear as the technical fields are not numbered.[23]

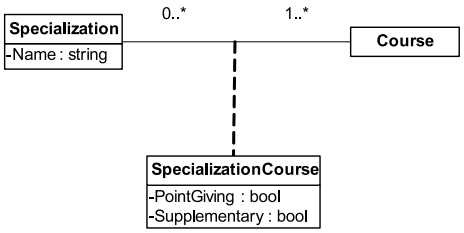

Figure 3.32: Logical model of the `Specialization` class and its association to the `Course` class. As well a logical model of the association class `SpecializationCourse`.

The `Specialization` class has the following attribute:

Attribute Name	Description
Name	The name of the specialization – e.g. "Chemical Product Development" or "Water Resources".

The association class `SpecializationCourse` specifies whether the related courses are point giving and supplementary.

The `SpecializationCourse` association class has the following attributes:

Attribute Name	Description
PointGiving	Describes whether or not the associated course is point giving for the technical line.
Supplementary	Describes whether the associated course is main or supplementary in relation to the specialization.

3.8 StudyType

The `StudyType` class represents the possible study types like "Master of Science" or "Bachelor of Science" (figure 3.33). A student has only one study type and a study type may be associated with one or more students. A `StudyType` may be linked to one or more `TechnicalPackage` objects denoting the technical packages which apply to the study type.

The `StudyType` class has the following attribute:

Attribute Name	Description
Name	The name of the study type – e.g. "Master of Science" or "Bachelor of Science".

[22] http://www.adm.dtu.dk/studier/retninger/specialiseringer/kemitek/specialisering2_d.htm
[23] Requirements for how to handle this specialization are stated in section 4.1.4.

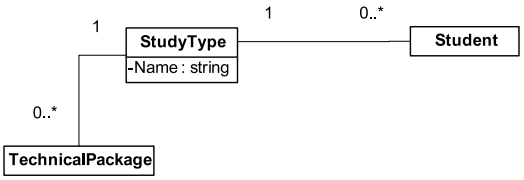

Figure 3.33: Logical model of the `StudyType` class and its associations to the `TechnicalPackage` and `Student` classes.

In order to finish a study of a given study type a certain amount of credit points must be achieved – e.g. Master of Science students must collect 300 ECTS points. These credit point requirements are represented by the association named *Total* in figure 3.34.

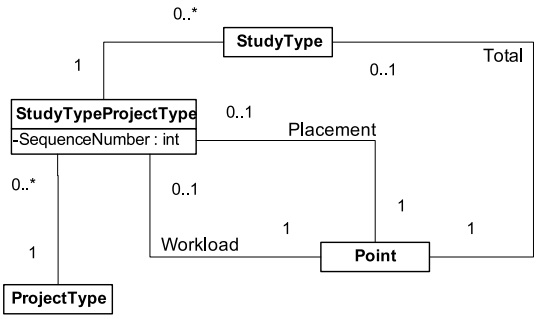

Figure 3.34: Logical model of the association between the `StudyType` and `Point` classes. As well the logical model of `StudyTypeProjectType` class and its associations to the `Point` and `ProjectType` classes.

Furthermore students must also complete a number of projects of specified types during the course of study – e.g. Master of Science students must complete a mid-way project [10]. In figure 3.34 this condition is represented by the `StudyTypeProjectType` and `ProjectType` classes.

The *Placement* association to the `Point` class denotes the interval of credit points which should have been collected prior to scheduling the project and the *Workload* association to the `Point` class denotes the workload of the project.

The `StudyTypeProjectType` class has the following attribute:

Attribute Name	Description
SequenceNumber	If multiple projects are to be finished the sequence number specifies the order in which the projects should be finished.

3.9 StudyPlan

A study plan is a course of study for the periods from when the study plan is made until the student has finished his education. The student tailors his study plan to suit his interests and specific demands of courses, technical package and technical line.

A study plan is represented by the `StudyPlan` class.

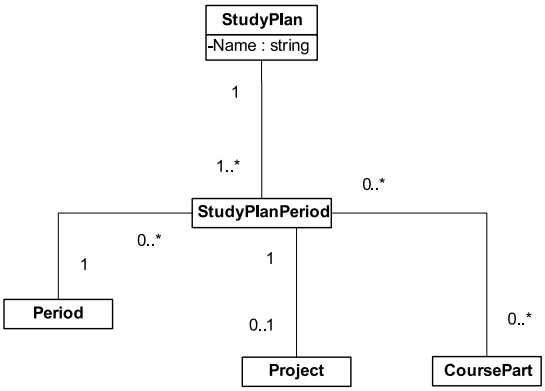

Figure 3.35: Logical model of the `StudyPlan` class and its association to the `StudyPlanPeriod` class. Moreover, a logical model of the associations between the `StudyPlanPeriod` class and the `Period`, `Project` and `CoursePart` classes.

The study plan consists of one or more study plan periods. The duration of a study plan period is determined by the `Period` (section 3.14) object to which it is linked (figure 3.35). Each period of the study plan contains the courses (course parts) or the project which the student has scheduled in that period. At most one project may scheduled in each period since a project has its own individual period which may overlap the course periods.

The `StudyPlan` class has the following attribute:

Attribute Name	Description
Name	The name of the study plan chosen by the student.

3.10 Keyword

To describe the contents of a course the lecturer may use a set of keywords. Students can then find courses which match their interests by searching for keywords associated with the courses.

A keyword is represented by an instance of the `Keyword` class (figure 3.36).

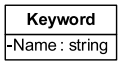

Figure 3.36: Logical model of the `Keyword` class.

The `Keyword` class has the following attribute:

Attribute Name	Description
Name	The name of the keyword – e.g. “Programming”, “Mechanics” or “Molecular geometry”.

3.11 Person

A person is an individual human being and is represented by the `Person` class. Examples of persons are students and lecturers.

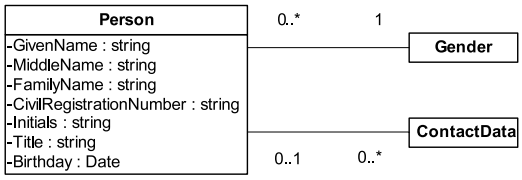

Figure 3.37: Logical model of the `Person` class and its associations to the `ContactData` and `Gender` classes.

A person has a gender (confer subsection below) and each `Person` object is therefore linked to a `Gender` object (figure 3.37). To this may be added one or more sets of contact data (section 3.12) e.g. private and corporate contact data.

The `Person` class has the following attributes:

Attribute Name	Description
GivenName	The given name of the person (also known as first name).
MiddleName	The middle name of the person.
FamilyName	The family name of the person (also known as surname).
CivilRegistrationNumber	The civil registration number of the person. The number uniquely identifies a person in the country of which the person has his primary citizenship. In Denmark the civil registration number is a 10 digit number which all Danish citizens are assigned by the "Centrale Personregister". The first six digits of the number is the citizen's date of birth, the next three digits comprise a serial number and the last digit is a check number.
Initials	The initials of the person.
Title	The title of the person.
Birthday	The person's date of birth.

3.11.1 Gender

Human beings are divided into two groups of gender: the masculine and the feminine gender. A gender is represented by the `Gender` class (figure 3.38).

The `Gender` class has the following attribute:

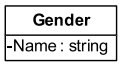

Figure 3.38: Logical model of the `Gender` class.

Attribute Name	Description
Name	The name of the gender e.g. “Female”.

3.12 ContactData

The `ContactData` class represents the contact information – i.e. address, phone numbers *&c.* – of a person or a department (figure 3.39). A person may have several contact data of different types – e.g. “Private” or “Corporate”.

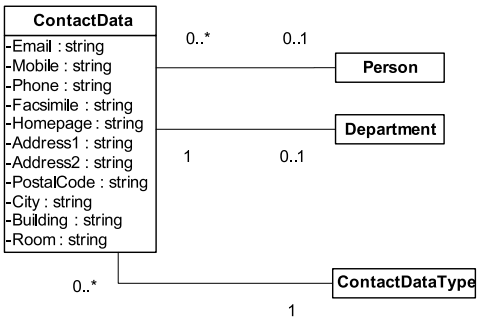

Figure 3.39: Logical model of the `ContactData` class and its associations to the `ContactDataType` and `Person` classes.

The `ContactData` class has the following attributes:

Attribute Name	Description
Email	The email address of the contact.
Mobile	The mobile phone number of the contact.
Phone	The phone number of the contact.
Facsimile	The facsimile number of the contact.
Homepage	The url for the home page of the contact.
Address1	First line of the contact address.
Address2	Second line of the contact address.
PostalCode	The postal (zip) code of the contact.
City	The name of the city of the contact address.
Building	The building number where the contact is located.
Room	The room number of the contact’s office.

3.12.1 ContactDataType

The `ContactDataType` class represents the possible types of contact data (figure 3.40).

Figure 3.40: Logical model of the `ContactDataType` class.

The `ContactDataType` class has the following attribute:

Attribute Name	Description
Name	The name of the contact type – e.g. "Private" or "Corporate".

3.13 Point

The `Point` class defines a fixed number of credit points for instance 5 points as well as an interval of credit points like for example $[0; 180]$.

When used to represent the number of credit points obtained by passing a course or a project the fixed number is used (figure 3.41). The generalization between the `Point` and `PointFixed` classes represents this property.

The `Point` class is also used to specify a lower and an upper bound of desired workload in a period e.g. $[10; 25]$ or to define a recommended placement (section 3.8) by specifying an interval of credit points which should be collected. This property is represented by the generalization between the `Point` and `PointInterval` classes.

Finally, the `Point` class may also be used to represent a lower bound only – used when the upper bound is unspecified. For example to start his thesis a Master of Science student must have collected at least 235 credit points [10].

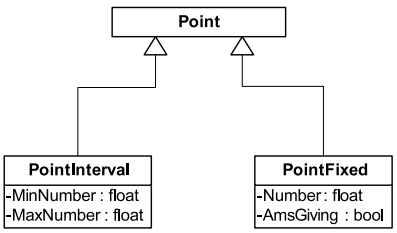

Figure 3.41: Logical model the `PointInterval` and `PointFixed` classes and their generalizations to the `Point` class.

The `PointInterval` class has the following attributes:

Attribute Name	Description
MinNumber	The lower bound of a credit point interval.
MaxNumber	The upper bound of a credit point interval.

The `PointFixed` class has the following attributes:

Attribute Name	Description
Number	Used when the instance is representing the workload of a course or project or required amount of points for a given study type.
AmsGiving	Specifies whether the instance also assigns AMS[24] points to the student.

3.14 Period

A period is a time span of variable length. A given period starts at some point in time and ends at some other point later in time.

The `Period` class represents a period.

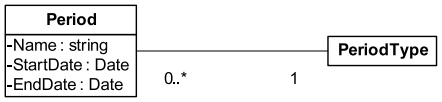

Figure 3.42: Logical model of the `Period` class and its association to the `PeriodType` class.

Each period is of some type as it appears in figure 3.42. The type of a period is represented by an association between the `Period` and the `PeriodType` class.

The `Period` class has the following attributes:

Attribute Name	Description
Name	The name of the period.
StartDate	The start date of the period.
EndDate	The end date of the period.

3.14.1 PeriodType

Each period is of some type and a period type is represented by the `PeriodType` class (figure 3.43). A `PeriodType` object may for instance be "13-week period" which is a common teaching period[25] at DTU – or "Individual period" for periods of individual character.

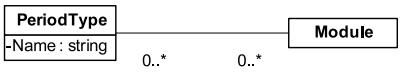

Figure 3.43: Logical model of the `PeriodType` class and its association to the `Module` class.

A period type may be split up into modules – two or more if it is to make sense. Confer section 3.15 for a description of the `Module` class.

The `PeriodType` class has the following attribute:

[24] http://www.adm.dtu.dk/studier/ams_d.htm
[25] [10], page 12.

Attribute Name	Description
Name	The name of the period type.

3.15 Module

A module is the name of a certain period of time on a given weekday. There may be none or several modules on the same weekday (section 3.20), but a module only occurs once a week.

A module is represented by the `Module` class (figure 3.44).

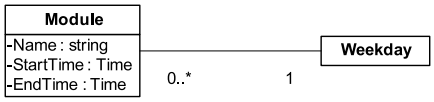

Figure 3.44: Logical model of the `Module` class and its association to the `Weekday` class.

The timetable used at DTU is shown in figure 3.45.

Time	Mon	Tue	Wed	Thu	Fri
8:00 – 12:00	1A	3A	5A	2B	4B
12:00 – 13:00	Break	Break	Break	Break	Break
13:00 – 17:00	2A	4A	5B	1B	3B

Figure 3.45: The original timetable

At DTU there are no modules after 17:00, however, some courses are taught from 17:00 to 21:00 – e.g. courses `02115`, `02393` and `42966` – which makes it convenient to introduce five new modules Monday through Friday from 17:00 to 21:00. With introduction of the new modules the resulting weekly timetable looks like this:

Time	Mon	Tue	Wed	Thu	Fri
8:00 – 12:00	1A	3A	5A	2B	4B
12:00 – 13:00	Break	Break	Break	Break	Break
13:00 – 17:00	2A	4A	5B	1B	3B
17:00 – 21:00	6	7	8	9	10

Figure 3.46: The modified timetable

The `Module` class has the following attributes:

Attribute Name	Description
Name	The name of the module – e.g. “2A” or “3B”.
StartTime	The start time for courses in this module – e.g. 08:00 or 13:00.
EndTime	The end time for courses in this module – e.g. 12:00 or 17:00.

3.16 Assessment

An assessment is the evaluation of an oral or written examination, a paper, a project work *&c.* The `Assessment` class represents an assessment (figure 3.47).

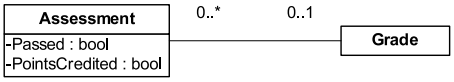

Figure 3.47: Logical model of the `Assessment` class and its association to the `Grade` class.

The `Assessment` class has the following attributes:

Attribute Name	Description
Passed	Indication of whether the student has passed or failed the course or project (specification is only necessary if the course or project is assessed as passed/failed).
PointsCredited	Indication of whether points should be credited. In some cases points are credited even though a "Fail" or a grade less than 6 is given. Special rules apply both for Bachelor of Science students (see [10], page 19) and Master of Science students (see [10], page 71).

3.17 AssessmentType

Courses and projects can be assessed in different ways. The `AssessmentType` class represents a way whereupon a course or a project can be assessed (figure 3.48). An `AssessmentType` object may for instance be "Pass/Fail" or "13-scale".

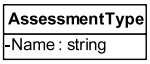

Figure 3.48: Logical model of the `AssessmentType` class.

The `AssessmentType` class has the following attribute:

Attribute Name	Description
Name	The name of the assessment type.

3.18 Grade

The `Grade` class represents the possible grades in the 13-scale grade system[26] (figure 3.49).

The `Grade` class has the following attributes:

[26] http://www.retsinfo.dk/_GETDOCM_/ACCN/B19950051305-REGL

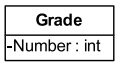

Figure 3.49: Logical model of the `Grade` class.

Attribute Name	Description
Number	Numeric representation of the grade number – i.e. 0, 3, 5, 6, 7, 8, 9, 10, 11 or 13.

3.19 Language

A language is represented by the `Language` class (figure 3.50). A language object may for instance be "English" or "Danish".

Figure 3.50: Logical model of the `Language` class.

The `Language` class has the following attribute:

Attribute Name	Description
Name	The name of the language.

3.20 Weekday

The `Weekday` class represents the days of the week (figure 3.51) as used in the Gregorian Calendar.

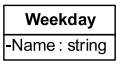

Figure 3.51: Logical model of the `Weekday` class.

The `Weekday` class has the following attribute:

Attribute Name	Description
Name	The name of the weekday e.g. "Monday".

Chapter 4

Requirements Specification

In this chapter we describe the requirements posed to a study planning system. The system has to meet every requirement specified in this chapter.

We more specifically describe the requirements posed with respect to data (section 4.1), functionality (section 4.2) and quality (section 4.3). Furthermore, a number of other requirements are stated (section 4.4).

In the requirements specification we use "supplier" as a designation of the company (or the like) who is supposed to implement the specified system. Accordingly, "customer" is used as a designation of the institution (or the like) who needs to have the specified system implemented.

It is impossible to specify every requirement down to the last detail – and unreasonable if the requirements specification is to be a useful document in the design and implementation of the system. For this reason there may very likely be several implied requirements, however, we expect the supplier to enter into a current dialogue with the customer in order to find solutions to any unclarified issues.

4.1 Data Requirements

In this section we specify the requirements made with respect to data. According to [18] data requirements deal with specifying "the data to be stored in the system, no matter whether data is stored as a database or in some other way".

The system should be capable of storing data corresponding to the logical models and descriptions presented in chapter 3 taking into account the limitations and additional data requirements introduced in this section. No demands are made on the physical data model.

Subsection headings in this section correspond to the names of the various entities by which it is convenient to look up entities in the table of contents.

4.1.1 Course

Courses change over time – for example the number of credit points may be increased/reduced or the assessment type may change. In order to retain a full history of courses it must be possible to store different versions of a course.

As mentioned in the "Modules" section on page 17 the vast majority of courses use the specification shown in figure 3.8 to describe the modules in which the course is taught. So for the purpose of simplicity only the above-mentioned specification of modules should be implemented.

Regarding course interdependencies only three courses use the specification in figure 3.12 to describe dependencies to other courses so only the specification shown in figure 3.11 should be implemented.

4.1.2 Student

A student alters over time – e.g. the student may change to another study type or technical package. In order to retain a full history of the student it must be possible to store different versions of a student.

The system should be capable of storing every sign up and examination attempt of the individual course in that rules apply with respect to the permissible number of repeater attempts.

4.1.3 TechnicalPackage

A technical package changes over time – e.g. at DTU new versions of each technical package are introduced every year. In order to retain a full history of the different technical packages it must be possible to store different versions of a technical package.

As stated in section 3.6.2, a project being part of a technical package must be executed in a specific period. However, a student may fail courses or e.g. be on leave for half a year and thus be delayed in his study. In such cases the student is not able to complete the project work in the specified period. In order to perform an expedient study planning it must therefore be possible to store an interval in the course of study (independent of specific periods) during which the project should be scheduled. This is done by linking each `TechnicalPackageProject` object to a `Point` object (figure 4.1) specifying an interval of points.

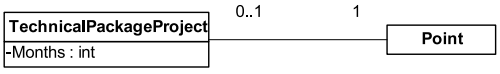

Figure 4.1: Logical model of the association between the `TechnicalPackageProject` class and the `Point` class.

Ideally, the project should be scheduled in the period specified for the project. Owing to some unforeseen circumstances (e.g. pregnancy and maternity leave) this may not be possible and the project should alternatively be scheduled in a period in which the student has at minimum obtained the specified number of points and has not exceeded the specified maximum number of points.

The `TechnicalPackageProject` class has the following attribute:

Attribute Name	Description
Months	The number of months the project work is supposed to last.

4.1.4 TechnicalLine

Technical lines may change over time – e.g. new courses are created and existing courses are discontinued. In order to retain a full history of technical lines it must be possible to store different versions hereof.

As mentioned in section 3.7.2 on page 29 the four specializations of the technical line "Applied Chemistry and Chemical Engineering" differ from the specializations of all other technical lines by being divided into an additional number of subcategories. The specification of specializations must follow the form used by all other technical lines and hence the quirkiness of the above-mentioned technical line shall not be supported in its current form. However, once it has been rewritten this technical line must be supported by the system.

4.1.5 StudyType

Study types may change over time – e.g. the required total number of credit points may change or the study type may apply to different technical packages. In order to retain a full history of study types it must be possible to store different versions hereof.

4.1.6 Grade

Grades must have both a numeric and a string representation. The numeric representation is used when computing grade averages. When presenting the grade to a user the string representation is used. To avoid possible misunderstandings and fraud attempts – e.g. accidentally writing a "1" in front of the grades – "0" and "3" are traditionally represented as "00" and "03" in the string representation which also eliminates the need for conversion between the two representations.

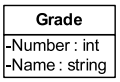

Figure 4.2: Logical model of the `Grade` class.

The extended `Grade` class has the following attributes:

Attribute Name	Description
Number	Numeric representation of the grade number – i.e. 0, 3, 5, 6, 7, 8, 9, 10, 11 and 13.
Name	String representation of the grade number – i.e. "00", "03", "5", "6", "7", "8", "9", "10", "11" and "13".

4.1.7 StudyPlanCriterion

A study plan criterion is an assembly of specifications on the basis of which the system should elaborate a study plan. The `StudyPlanCriterion` class is a representation of a study plan criterion.

It is the individual student who is assumed to state the specifications of a study plan criterion previous to the system's elaboration of a study plan.

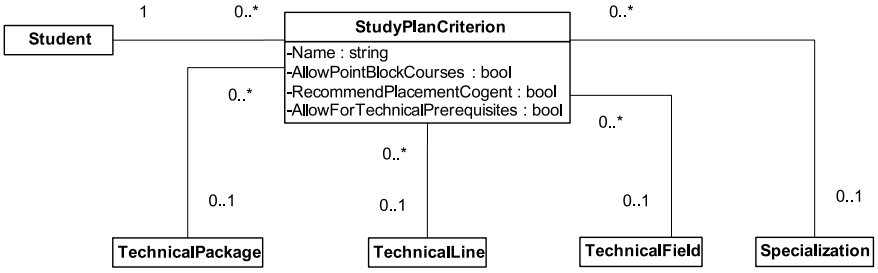

Figure 4.3: Logical model of the `StudyPlanCriterion` class and its associations to the `Student`, `TechnicalPackage`, `TechnicalLine`, `TechnicalField` and `Specialization` classes.

According to figure 4.3 a student may have one or more study plan criteria.

The student may specify that he wants to complete a specific technical package. It is possible to determine which technical package a given student is currently signed up for, however, if the student ponders switching to another technical package it may be very relevant to specify the technical package considered.

Likewise, a Master of Science student may specify which technical line he wants to obtain. For a given student is possible to ascertain which technical line the student is presently signed up for, however, if the student ponders switching to another technical line it may be crucial to specify the technical line considered.

The student may furthermore – if a technical line is specified – choose to follow a recommended course of study by specifying a technical field or a specialization.

The `StudyPlanCriterion` class has the following attributes:

Attribute Name	**Description**
Name	The name of the study plan criterion chosen by the student.
AllowPointBlockCourses	Specifies whether or not point blocking courses may be scheduled.
RecommendedPlacementCogent	Specifies whether the recommended placement of courses should be respected or ignored.
AllowForTechnicalPrerequisites	Specifies whether technical prerequisites for courses should be respected or ignored.

The student may specify a desired workload by means of an amount of credit points which should be obtained within a period (figure 4.4). This may be done either generally per period type or for specific periods.

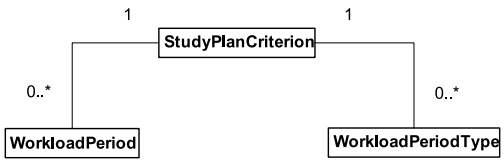

Figure 4.4: Logical model of the associations between the `StudyPlanCriterion` class and the `WorkloadPeriod` and `WorkloadPeriodType` classes.

A `StudyPlanCriterion` object may be linked to one or more `WorkloadPeriod` objects which represent the student's desired workload in specific periods. Moreover, a `StudyPlanCriterion` object may be linked to one or more `WorkloadPeriodType` objects which represent the student's default desired workload in different period types. Confer the subsections "WorkloadPeriod" and "WorkloadPeriodType" below for an in-depth description of these classes.

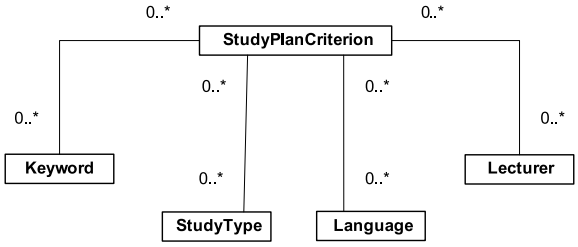

Figure 4.5: Logical model of the associations between the `StudyPlanCriterion` class and the `Keyword`, `StudyType`, `Language` and `Lecturer` classes.

Fields of interest may be specified in the form of keywords (figure 4.5).

The student may choose also to consider courses offered to study types distinct from the student's own study type. One could for instance imagine that a Bachelor of Science student would choose also to consider courses offered to Master of Science students.

Selection of one or more languages is possible. A Danish student may e.g. select both "Danish" and "English" as languages.

In the same way one or more lecturers may be deselected (all lecturers are considered selected by default). A student may e.g. choose to deselect a lecturer if he does not like the lecturer's way of teaching or the like.

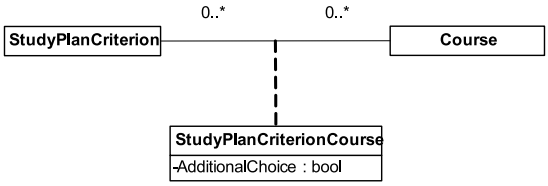

Figure 4.6: Logical model of the association between the `StudyPlanCriterion` and `Course` classes. Moreover, a logical model of the association class `StudyPlanCriterionCourse`.

The student can explicitly choose one or more courses which should be scheduled at some time during the course of study (figure 4.6). These courses may be scheduled at any time during the course of study. Likewise, the student can also deselect any number of courses which means that these courses will never be scheduled (unless this clashes with other criteria). This

property is represented by the `StudyPlanCriterionCourse` association class introduced in figure 4.6.

The `StudyPlanCriterionCourse` association class has the following attribute:

Attribute Name	Description
AdditionalChoice	Specifies whether the course should be scheduled at some time during the course of study or never.

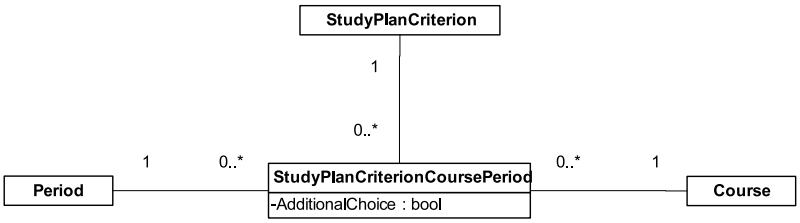

Figure 4.7: Logical model of the association between the `StudyPlanCriterion` and `StudyPlanCriterionCoursePeriod` classes. Moreover, a logical model of the associations between the `StudyPlanCriterionCoursePeriod` class and the `Period` and `Course` classes.

A student may choose to manually schedule one or more select courses in a specific period which corresponds to the traditional, manual study planning (figure 4.7). Likewise, the student can manually deselect courses in a specific period meaning that these courses will not be scheduled in that period.

The `StudyPlanCriterionCoursePeriod` association class has the following attribute:

Attribute Name	Description
AdditionalChoice	Specifies whether the course should be scheduled in the specific period or not.

As described in sections 3.4 and 3.5, students must prepare one or more projects during their studies. In order to execute a more rational study planning the student may choose to specify the workload of each project in different time intervals (figure 4.8). For example the student might want to specify the workload of a 12.5 point project as follows:

Interval	Points
1 – 20%	5.0
21 – 80%	5.0
81 – 100%	2.5

The `ProjectWorkload` class has the following attributes:

Attribute Name	Description
FromPercent	Specifies the lower bound of the workload interval e.g. 20%.
ToPercent	The upper bound of the workload interval e.g. 80%.

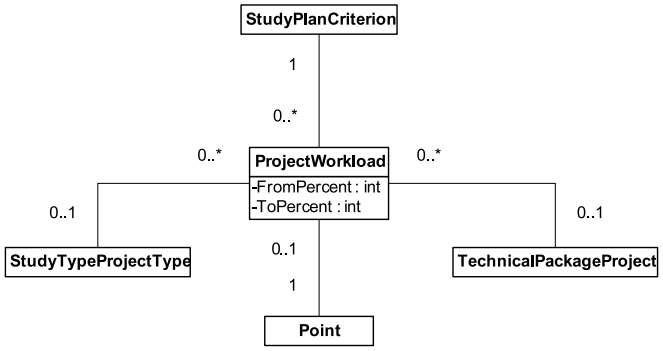

Figure 4.8: Logical model of the association between the `StudyPlanCriterion` and `ProjectWorkload` classes. Moreover, a logical model of the associations between the `ProjectWorkload` class and the `TechnicalPackageProject`, `StudyTypeProjectType` and `Point` classes.

WorkloadPeriod

A workload period describes the workload – i.e. the minimum and maximum number of credit points – desired by the student in a specific period (figure 4.9). For example a student may specify a desired workload of 15 to 25 points for the 13-week period in the spring 2003.

Furthermore, a student may deselect specific modules in a period. This means that no courses will be scheduled in these modules during the period. If a student wants to play tennis every Tuesday afternoon he or she can deselect the module(s) on Tuesday afternoons of the week schedule. In DTU terms that would be the module 4A – confer section 2.2.2 for a description of the week schedule used at DTU.

A workload desired for a specific period takes precedence of the workload desired generally in periods of the same type (confer subsection below).

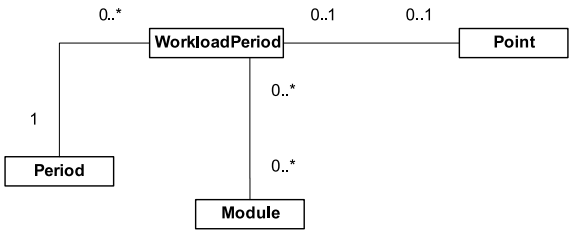

Figure 4.9: Logical model of the associations between the `WorkloadPeriod` class and the `Period`, `Module` and `Point` classes.

WorkloadPeriodType

A workload period type describes the workload – i.e. the minimum and maximum number of credit points – desired by the student in specific period types (figure 4.10). This is the general setting which is used for all periods of the selected period type unless it is overruled by a `WorkloadPeriod` object introduced in figure 4.9.

For example a student may specify a default desired workload of 25 points for all 13-week periods and a workload of 5 points for all 3-week periods. However, suppose the student

wants to go on summer holiday in June 2003 and thus he will specify a desired workload of 0 points in the 3-week period in June 2003. This will then overrule the general setting and no courses will be scheduled for this period.

A student may deselect chosen modules in a specific period type. This means that no courses will be scheduled in these modules for all periods of this particular period type.

Now, consider again the above-mentioned example with the student who wants to play tennis every Tuesday afternoon. Suppose the tennis lessons are rescheduled from Tuesday afternoons to Thursday afternoons for the second half of the year 2003. The student will then specifically reselect the Tuesday afternoon module(s) and deselect the Thursday afternoon module(s) for the specific periods during the second half of the year 2003. No courses will then be scheduled for Thursday afternoons until 2004 where the previous setting is restored.

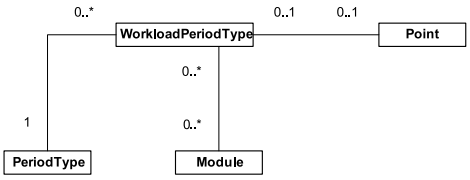

Figure 4.10: Logical model of the associations between the `WorkloadPeriodType` class and the `PeriodType`, `Module` and `Point` classes.

4.2 Functional Requirements

In this section the requirements made with respect to functionality are specified. With reference to [18] functional requirements specify "what data is to be used for, how it is recorded, computed, transformed, updated. . . ".

Below is among other functional requirements described how the student should be able to manage his study plan criteria and elaborate a study plan from a study plan criterion.

4.2.1 Principal Requirement

The system must be web-based and users should therefore be able to operate the system by a web-browser.

4.2.2 Restricted Admission

Admission to the system must be restricted. When a person tries to access the system he should therefore be directed to a login page from which he can be authenticated and thereby get admission to the system.

Login Page

On the login page the user should be able to state his credentials – username and password – and request for admission. Upon request the system must validate the stated username and password.

If either the username or password is wrong the system must refuse the user's request for admission and inform so to the user. The user may try to login again, however, the user only has got a limited number of attempts, confer the subsection "Prevention of Brute Force Attacks" below.

The user should be authenticated if both the username and password are correct. An authenticated user may use the system freely, however, the user may only obtain access to those parts of the system which he has been authorized access to. Confer [12], § 12, and section 4.4.1.

Prevention of Brute Force Attacks

The system must prevent brute force attacks. In other words it must not be possible for unauthorized persons to carry out an exhaustive test of usernames and passwords in combination.

Every refused request for admission must be registered. If a request for admission has been refused three times in succession within the last five minutes for a given username the system should obstruct further requests for that username in a time interval of 20 minutes.

Password Policy

Users should be forced to change their password every 90 days. If the user has not changed his password within this time frame at login he should be forced to change his password before he is given admission to the system.

It is required that passwords meet the following complexity requirements:

- A password must at a minimum be eight characters long.
- A password must contain characters from at least three of the following categories:
  - English Lower Case Letters (a, b, c,... z)
  - English Upper Case Letters (A, B, C,... Z)
  - Westernized Arabic Numerals (0, 1, 2,... 9)
  - Non-alphanumeric, "special characters" (!@#$%&()_*-+={}[],.:/|)

Finally, a password must not be the same as any of the user's previous four passwords. The system must therefore maintain a log of the user's previous passwords.

4.2.3 Main Page

When a student has logged in, a main page shall be presented by the system from where it must be possible to get an overview of previously saved study plan criteria and study plans – where available.

From the main page it must be possible to enter the study plan criterion management (section 4.2.4) or the study plan management (section 4.2.5).

The system must allow deletion of study plan criteria or study plans either from the main page or from the respective management functions. The supplier shall provide a suggestion as to which of the two is the more appropriate solution.

4.2.4 Study Plan Criterion Management

Students must be able to manage a number of study plan criteria in the system. Partly, a student should be able to create a new study plan criterion and partly modify and delete existing study plan criteria. Moreover, it should be possible to elaborate a study plan from a study plan criterion.

Creation

The creation of a study plan criterion consists in the student specifying his interests, specific demands *&c.*

The student should be able to specify which *technical package* he wants to complete – if different from the one he is already signed up for. M.Sc. students should be able to select a technical line as well as a specialization. Only technical package and technical line relevant for the student's study type should be selectable.

As regards the student's *interests* it should be possible for the student to specify those as keywords.

Desired *workload* by means of an amount of credit points should be specifiable both generally per period type and for specific periods.

A study plan should reflect the student's language skills and the student should therefore be able to select one or more *languages* in which he wants to be taught. One or more *lecturers* should be deselectable as all lecturers are selected by default and the student may not wish to be taught by certain lecturers.

The student should be able to choose one or more *study types* in addition to the student's own study type. The different study types should be selectable from a list.

It should be possible for the student to choose one or more *specific courses* which the student would like to have scheduled at some time during the course of study. In the same way the student should be able to choose one or more courses which should never be scheduled. Likewise, for specific periods the student should be able to select and deselect one or more courses – such a specification corresponds to traditional, manual study planning.

The student should be able to define whether the *technical prerequisites* of the courses should be taken into account or not.

As far as *projects* are concerned the student should be able to specify the amount of workload associated with a project in different parts of the project. The student should be able to make such a specification for each of the projects the student is going to prepare.

The student should be able to state a *name* for the study plan criterion such that the student can identify it later on.

Finally, it should be possible to *save* a study plan criterion.

Modification and Deletion

A student should be able to modify and delete existing study plan criteria. It should be possible to modify the same criteria which were possible to specify at the creation of a study plan criterion. If a student chooses to delete a study plan criterion he should confirm this choice before the actual deletion is executed.

Study Plan Elaboration

From a given study plan criterion the student should be able to request an elaboration of a study plan.

A study plan should be elaborated according to the guidelines described in section 4.2.6.

4.2.5 Study Plans

The system must allow the user to save any number of study plans and to assign a name to each individual study plan in order to facilitate identification of the study plan.

Presentation of a study plan should be as a list of courses (course number and course name) as well as projects grouped by study plan periods. The study plan period to which the courses or project belong must be clearly identified. Moreover, all courses shown must be linked to its associated description such that clicking a course will bring up the detailed description for the course.

The system should allow deletion of the study plans created by the user who is currently logged in. It should not be possible to edit study plans manually as this may violate the assumptions made for other study plan periods and thus introduce inconsistency in the study plan.

4.2.6 Study Plan Routine

The study plan routine should elaborate a study plan on the basis of a given study plan criterion. In the following is outlined the chief mode of operation of the study plan routine.

The routine should begin by generating a set of courses which matches the student's interests i.e. the specified keywords. To this set must be added those courses explicitly desired by the student.

If any of the courses in the set are taught in a language or by a lecturer deselected by the student these courses should be removed from the set. Courses comprised by the student's technical package (or the one selected) should be added to the set and if the student has desired to complete either a technical line or a specialization then the courses comprised hereby should be added to the set.

Those courses explicitly deselected by the student should be removed from the set. The same applies for those courses already finished by the student.

The set of courses should be distributed among the different periods in consideration of desired workload and possible parallel projects. The succession in which courses are arranged should be expedient by considering mandatory and possibly technical prerequisites.

If a course consists of multiple parts, the individual parts must be scheduled sequentially in ascending order in the first possible periods in which they are taught as mentioned in section 3.3.1.

The study plan should be elaborated such that it is primarily composed of courses from the technical package and from a possible specified technical line or specialization. The courses

explicitly selected are of secondary importance. Courses matching the student's interests by means of keywords have of all lowest priority[1].

The routine should – given a student's identity – be able to compute how many credit points the student has achieved and has to achieve in order to complete his study. Having this information the routine has knowledge of how many credit points in the form of courses for which a study plan should be made.

The further particulars with regard to how the study plan routine should function is to be mapped out in close and current collaboration between the customer and the supplier.

4.2.7 Culture Versioning

The system shall support Danish and British cultures including the correct formatting of culture dependent fields such as dates, currencies, numbers, sort orders for strings *&c.*

For future use the system shall be able to cope with other European cultures.

4.2.8 Persistent Functionality

The system shall allow the user to perform the following functions anywhere in the system i.e. the functions must always be accessible:

- Switch to the home page.
- Log off the system.

4.3 Quality Requirements

In this section we specify the requirements made with respect to quality – also known as non-functional requirements. According to [18] quality requirements specify "how well the system must perform its functions".

Below we more specifically describe capacity, performance, usability, security and extensibility requirements.

4.3.1 Capacity

It is expected that on average 2% of the users (students) – corresponding to approximately 120 users[2] – will use the system simultaneously. However, the system must be able to handle peak loads of up to five times as many simultaneous users which are likely to occur the last few days before the course sign up deadlines for each period.

Below some initial capacity requirements are introduced along with the expected yearly growth rate.

[1] Immediately, it may sound peculiar that the student's interests have a low priority, however, the mandatory courses must inevitably be passed in order to start the technical line and specialization (which the student also has selected by interest). Furthermore the student's interest are represented by keywords and since the keywords associated with the courses are not weighted it is impossible to determine how large a part of the course actually matches the various keywords.

[2] The estimate is based on the number of students at DTU in 2003.

Object type	Initial capacity	Expected yearly growth
Student	6.000	1.000
Course	1.000	100
Department	20	0
Lecturer	1.200	120
Study Plan	12.000	4.000

Initially, there are no study plans in the system, however, it is anticipated that every student will create an average of two study plans shortly after implementation of the system.

Initial capacity

The initial capacity of the system must be sufficient to store all students, all courses, all departments, all lecturers *&c.* Furthermore, the system must initially have a capacity that can handle at least two study plans per student.

Scalability

The system must be scalable since it is anticipated that most students will use the option to create multiple study plans. Moreover, new courses and projects are created on a regular basis and existing courses and projects are altered and thus resulting in a new version of the course or project.

4.3.2 Performance

Response time for elaborating a study plan shall be at most 20 seconds in 95% of the cases. In 50% of the cases the response time shall be less than ten seconds.

The specified response time is on the server side alone disregarding any internet delay as the supplier cannot be held responsible for possible internet lags. The system must run on existing hardware which the above-mentioned response times allow for. Specifications for the hardware are available upon request.

4.3.3 Usability

Use of the system should to a great extent be self-explanatory and users should be able to use the basic features of the system without prior instruction. Notice, the primary target group of the system is students which is a group of young users likely of being experienced with the Web and using web applications.

The system should efficiently support the user's tasks. As an example a user should not have to split a given task up into unnecessarily many sub-tasks and execute those in different parts of the system in order to complete the overall task.

The system must be capable of taking over tasks on a detailed level such that users need not enter information which the system is able to derive from existing information.

4.3.4 Security

As regards security the system must take precautions against a number of issues on that subject.

When transmitting information over the internet there is a risk that the information is read by third party. In some cases information of sensitive character (e.g. grades) have to be transmitted and such information are encompassed by §§ 7-8 in [12], confer section 4.4.1. In order to ensure confidentiality the transmission between client and server must be done via the https protocol in conformity with recommendation of "The Danish Data Protection Agency" ([25]).

The system must not be vulnerable to injections into the data base (SQL, XPath or the like injections) and buffer overruns. As the described system is to become a web application the system should also make countermeasures in respect of URL tampering, content suction and script injections[3].

4.3.5 Extensibility

The system must be designed and implemented in a way that allows for future extensions which may reasonably be expected. Extensions must be implementable without requiring a fundamental redesign of the system.

4.4 Other Requirements

In this section the remaining requirements are specified. These requirements do not fall into the categories of the requirements already specified.

4.4.1 Legal Requirements

The system must abide by the regulations of [12] on the protection of individuals with regard to the processing of personal data.

In this requirements specification a number requirements have been presented which ensure observance of the regulations in [12]. However, on the basis of the afore-mentioned act the supplier must determine whether further initiative is necessary in order to satisfy the requirements specified herein. If this is the case the supplier must see to it that the system supports these measures.

4.4.2 User Interface Requirements

The supplier should draw up prototypes of the user interface (also known as virtual windows) before developing the actual user interface. These prototypes should be debated with the customer and altered accordingly. The actual user interface should of course then be developed on the basis of the final prototypes.

[3] At discretion, examples of the different types of attacks are given in [2], chapter 2.

At all times the user should have a general view of the current part of the system being used and where that part is placed in the navigation hierarchy.

The graphical design should be professional and simple in order to prevent unnecessary absent-mindedness from the user's tasks.

The system should be usable in the screen resolutions as follows: 800×600, 1024×768 and 1280×1024. No matter which screen resolution the user has the whole screen area should be exploited.

4.4.3 Technical Requirements

On the server side the system must be able to run on the existing hardware. Specifications for the existing hardware are available upon request.

On the client side the system will be used from a number of different platforms and therefore the client must comply to the following standards in the version specified or higher:

- JavaScript version 1.2
- Cascading Style Sheets (CSS) level 2
- Document Object Model (DOM) version 1
- HyperText Markup Language (HTML) version 4.01
- Secure Sockets Layer (SSL) version 3.0

4.4.4 System Design and Programming

Only a few requirements are made on system design and programming.

It is required that the system architecture is divided into at least three tiers: one tier for handling presentation, one tier for managing business logic and one tier for handling storage of data. The system architecture may be divided into further tiers e.g. by dividing the business tier into a user-oriented and a data-oriented tier, however, the principal requirement is that the system has a clear-cut separation between presentation logic, business logic and data.

The system is required to be developed based on object-oriented principles.

4.4.5 Documentation

Documentation is required to be supplied with the system.

The documentation should include:

- Description of data structures. The entities of the physical data model are to be described and for each entity it should appear:
  - what purpose the entity serves.
  - how the entity is related to other entities.
- Description of file structure. For each file it should appear:
  - what purpose the file serves.
  - how the file is possibly related to other files.
- Description of components. For each component it should appear:

  - what purpose the component serves.
  - how the component is possibly related to other components and entities in the database.
- Description of other parts such that adequate documentation is available of every part of the system.

The system documentation is expected to be supplied in electronic form as a number of coherent web pages and images.

In addition, there should be comments in the source code itself. The comments are required to have an extent such that outsiders with necessary technical competence within reasonable time are able to get a clear comprehension of what the concerned source code does.

System documentation and source code comments should be in English.

Part II

System Design & Implementation

Chapter 5

Foundations

Based on the prepared requirements specification, we have implemented a system that supports automated study planning.

In this chapter we describe the foundations of the implemented study planning system. The following subjects will be covered:

- The chosen technology (section 5.1)
- Select aspects of the database design (section 5.2)
- The main architecture of the system (section 5.3)
- The distinct so-called tiers of the system (sections 5.4, 5.5 and 5.6)
- How errors are handled (section 5.7)

Documentation of the implemented system can be found at:

http://www.studyplanning.dk/documentation

5.1 Choice of Technology

As an initial step we will explain our choice of technology and considerations made in this connection.

5.1.1 Development Platform

Several development platforms qualify to support the development of the study planning system. We have, however, chosen to implement the system using Microsoft's .NET Framework.

The main reason for choosing .NET is that the system is intended to be employed at DTU. At the present time DTU already offers a number of services which are implemented by use of Microsoft technologies and it will – other things being equal – be easier to integrate the study planning system with these other systems if the systems are implemented in technologies from the same vendor.

In .NET the choice of programming language is a question of personal preference as several programming languages are supported[1], including:

[1] http://msdn.microsoft.com/vstudio/productinfo/whitepapers

- Visual Basic .NET
- Visual C# .NET
- Visual C++ .NET
- Visual J# .NET (Java in .NET)

We have chosen C# as the language to be. The choice of C# seemed direct as both of the authors have previously developed systems using Java and in our opinion it holds to argue that C# *is* indeed Java improved in a handful of fields. However, most often such a choice is a question of personal preference.

5.1.2 Storage of Data

As it appeared from section 4.1 the system needs to store a fairly heterogeneous quantity of data. The data has to be stored in some organized form and we first of all decided on using the following technologies for storing data:

- **A relational database system**
  A mature, prevalent, theoretically well-founded and efficient way of storing structured data. In addition, data is queried by means of the standardized SQL[2] language.

- **Extensible Markup Language – XML**
  A flexible, standardized way of storing semi-structured data. Moreover, data is queried by means of the standardized XPath and XQuery languages[3].

Which specific relational database system to choose? Again, several systems qualify. We have chosen to use Microsoft SQL Server as relational database system.

A number of reasons apply for this choice:

- SQL Server is well-integrated with .NET both as regards classes in the framework and efficiency.
- Storage and querying of XML is supported.
- The concept of stored procedures is supported which we prefer for architectural and security reasons.
- Both authors had prior experience with the concerned database system.

5.2 Database Design

In this section we elaborate on some select aspects of the database design. The following subjects will be covered:

- Reflections concerning primary keys (section 5.2.1)
- Globally unique identifiers (section 5.2.2)
- How versioning is handled (section 5.2.3)
- Tracking of changes (section 5.2.4)
- How culture versioning is handled (section 5.2.5)
- Considerations regarding referential integrity (section 5.2.6)

[2]SQL is an abbreviation for Structured Query Language – the language is described in e.g. [27], chapters 5-7.

[3]Descriptions of the XPath and XQuery languages can be found at http://www.w3c.org.

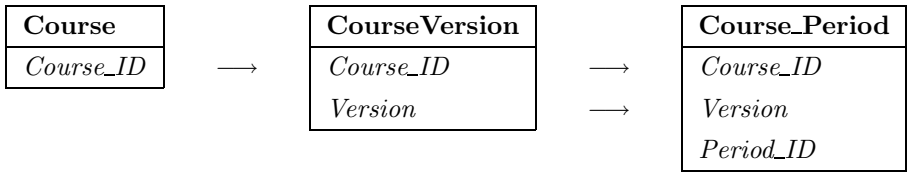
5.2.1 Primary Keys

When designing relational database tables an important part of the design is the definition of primary keys. Basically, the choice is between simple keys and compound keys or a combination of these.

To illustrate the differences between the two approaches an example using the two main entities for courses is shown in the following.

Using compound keys

The base table `Course` has the primary key `Course_ID`, the `CourseVersion` table has the compound primary key consisting of `Course_ID` and `Version` and the `Course_Period` table has a compound primary key consisting of `Course_ID`, `Version` and `Period_ID` as shown below where keys are in *italic*:

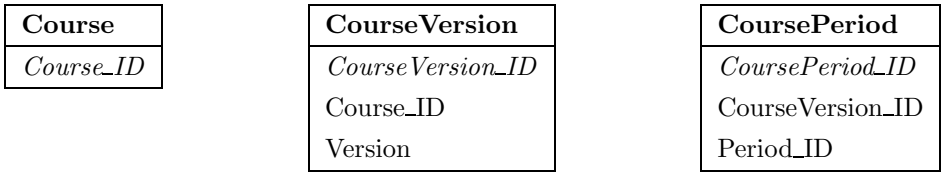


Using compound keys means that any table referencing the key from another table must include the primary key from that table as part of its own compound key. This is illustrated by the `CourseVersion` table which includes the primary key from the `Course` table and by the `Course_Period` table which includes the primary key from the `CourseVersion` table.

Extending the primary key of the `Course` table in the above-mentioned example with another attribute into a compound key would also imply changing the `CourseVersion` and `CoursePeriod` tables since their keys have been derived from the primary key of the `Course` table.

Using simple keys

The base table `Course` has the simple primary key `Course_ID`, the `CourseVersion` table has the simple primary key `Course_Version_ID` and the `CoursePeriod` table the simple primary key `Course_Period_ID` as shown below where keys are in *italic*:



When using simple keys each table has its own primary key consisting of only one attribute which is independent of other keys.

Compared to compound keys, simple keys are easier to reference since only one attribute must be referenced and not a compound key consisting of several attributes – e.g. when passing the key from one function to another. This also applies when programming the business and presentation tiers since a single value uniquely identifies the desired data record.

Since the primary key itself represents no data it is easy to extend the table with new attributes as the key will not have to be changed.

5.2.2 Globally Unique Identifiers

When defining keys for database tables one may use either logical keys or surrogate keys. A logical key consists of the actual data, which identify the record – e.g. for a table containing contacts the key might be the family name of the contacts. A surrogate key consists of unique, arbitrary values which abstractly represent the records in the table[4] – e.g. by assigning a number to each contact in the above-mentioned example.

Using logical keys is disadvantageous if the actual data in the key is subject to changes since foreign keys of all referencing tables would have to be updated each time the data changes.

Surrogate keys are typically represented as integers and many database systems can even increment the key automatically when inserting a new row into the table thus preventing duplicate keys. However, often the (automatically generated) key from one table must be inserted as a foreign key into another table which again depends on the foreign key of a third table. This means that the insertions must be carefully planned and executed in a specific order for this to work.

Moving data between multiple instances of the database – e.g. from a production system to a test system – may also be difficult when using this approach. The surrogate keys generated in the production system may already exist in the test system and thus the data cannot be inserted into the tables of the test system unless the offending records are deleted from the test system or the values of the keys are changed which may be an overwhelming task if several hundred tables are involved.

Another approach is to use a surrogate key which is guaranteed to be (almost) globally unique. Microsoft SQL Server and the .NET Framework have a built-in data type called "GUID" which is an abbreviation of "Globally Unique Identifier". The GUID is a 128 bit integer which is guaranteed to be (practically) globally unique. The generation of a GUID uses the encoding of the MAC address of the computer's network card as well as other machine specific information including some randomness (confer [13]). A GUID is usually written in hexadecimal form like the example below[5]:

```
936DA01F-9ABD-4D9D-80C7-02AF85C822A8
```

Using GUIDs solves the above-mentioned problems with integer keys, however GUIDs also have some disadvantages.

- They are long and difficult to type and as such unfit for presentation and printing on invoices *&c.*
- It is not possible to see in which sequence two GUIDs have been generated.
- Being 128 bit integers they do take up more space than regular 32 bit integers and scanning a database index containing GUIDs may be slightly slower than if the index contained 32 bit integers.

Considering the pros and cons of using integers or GUIDs we have come to the conclusion that the advantage of GUIDs being globally unique makes up for the space and speed disadvantages.

To make the best of approaches the study planning system uses both integer keys and GUID keys. Manually incremented integer keys are used on entities which are static or only rarely updated whereas GUIDs are used on entities which are updated regularly.

[4] http://www.miswebdesign.com/resources/articles/wrox-beginning-php-4-chapter-3-3.html
[5] http://msdn.microsoft.com/library/en-us/acdata/ac_8_con_03_2uox.asp

5.2.3 Versioning

Versioning is used whenever an instance is likely to change a number of times – e.g. courses, students or technical lines. For example the duration of a technical package is at least two and maximum four years. Technical packages are usually changed (slightly) every year which means that up to four different versions of a technical package must coexist.

If the amount of credit points for a course is changed from say 7.5 to 5 without creating a new version of the course, all students who have signed up for the course prior to the change are suddenly only credited 5 points for the course and they have no way of proving that the course was supposed to give 7.5 credit points because the previous information has been overwritten. If instead a new version of the course had been created the historical information would have been retained and could have been used as documentation.

The versioning is handled uniformly in the system by means of *base* entities and *version* entities. The base entity contains nothing but the identification of the instance whereas the version entity contains all information which is subject to changes. In the following example `Course` is the base entity and `CourseVersion` is the version entity:

Course
Course_ID
...

CourseVersion
CourseVersion_ID
Course_ID
Version
Number
Name
...

When to update the existing instance or create a new version is entirely up to the administrators of the system. However, for the versioning to make sense it is recommended that an instance is only updated when correcting a spelling or punctuation mistake and anything beyond these simple corrections should result in a new version of the instance. Changes of contents (semantic changes) such as a course description or the modules in which a course is taught should certainly result in a new version.

5.2.4 Change Tracking

Keeping track of changes to the database is important when trying to locate errors, for statistical purposes and as documentation of occurrences in the system.

To enable an expedient tracking of changes the following four attributes occur on every single table in the system:

Attribute	**DataType**	**Description**
Created	DateTime	Date and time of when the record was created
CreatedBy	GUID	User-id of the user who created the record
Updated	DateTime	Date and time of when the record was last updated
UpdatedBy	GUID	User-id of the user who last updated the record

Since it is not possible to determine in which sequence GUIDs[6] have been generated the `Created` attribute may be used to sort the records in sequence or to extract all records which have been created on a given date. If an erroneous change has been made to some data it is easy to locate the user who made the change by looking at the contents of the `UpdatedBy` attribute and then ask the user about the change.

5.2.5 Culture Versioning

The study planning system is going to be used by many students – foreign as well as Danish. Therefore the system shall at least support the Danish and English languages. However, restricting the system to a fixed number of languages may be a problem if the university some day wants to support German or French as well.

First and foremost culture versioning includes all texts in the study planning system which must be representable in multiple languages. Secondly culture versioning also affects the way dates and currencies are displayed as well as the sort order of strings, however, only the representation of texts in multiple languages will be covered in this section.

One way of introducing text in multiple languages is to store all texts in a separate table as in the example shown below where keys are in *italic*:

CourseVersion
CourseVersion_ID
Version
~~Name~~
~~Objective~~
...

TextTable
Key
TextGroup
TextNumber
Culture
Text

All text attributes are removed from the entities and instead represented as rows in the text table. In the example shown above the attributes `Name` and `Objective` will be removed from the `CourseVersion` table and transformed into rows in the `TextTable` like for example:

Key	**TextGroup**	**TextNumber**	**Culture**	**Text**
ABC	123	456	da-DK	Systemanalyse
ABC	123	456	en-GB	System Analysis
ABC	234	567	da-DK	A. At give en grundlæggende ...
ABC	234	567	en-GB	A. The students shall basically ...
...	...	...	...	...

This design is quite flexible when it comes to introducing new text attributes which can be added without the need for altering the table, however, it does have some disadvantages. Since all text attributes are gathered in one single table extracting data for statistical purposes requires many join operations to retrieve the correct texts for each record in a table. It may also be difficult to maintain a general view of the database when text attributes are gathered in one table while all other attributes are scattered around other tables. Furthermore, the `Key` field on the `TextTable` must be able to hold all types of keys like integers, strings, dates

[6] See section 5.2.2.

&c. Compound keys need special treatment as they must be concatenated in order to fit into the single `Key` field.

Another possibility is to use a combination of relational and semi-structured data like XML. In doing so the structure of the database remains intact – i.e. no attributes are removed from the entities. Instead multiple translations of texts are stored as XML in a single attribute of the entity. Using this approach on the example introduced above the attributes `Name` and `Objective` will contain the following:

Name	**Objective**
<cultures> <culture> <cultureID>en−GB</cultureID> <value>System Analysis</value> </culture> <culture> <cultureID>da−DK</cultureID> <value>Systemanalyse</value> </culture> </cultures>	<cultures> <culture> <cultureID>en−GB</cultureID> <value>A. The students shall basically ...</value> </culture> <culture> <cultureID>da−DK</cultureID> <value>A. At give en grundlæggende ...</value> </culture> </cultures>

Storing multiple values in a single attribute violates the rule of 1st normal form in database design which states that any attribute must contain only one single value ([27], page 153) however, this is a deliberate choice which has been made.

The advantage of combining semi-structured and relational data is that the structure of the database persists while providing the possibility of storing an arbitrary number of translations of a text in a single attribute. All records need not have the same number of cultures and introducing a new culture is a simple task.

One disadvantage is that a lot of space is wasted on meta-data. In the example above 174 characters are used to represent the contents of the `Name` attribute in two languages. Of this 79 % of the space is occupied by meta-data and the remaining 21 % contain the actual data of two languages. The amount of meta-data is constant and thus the meta-data to data ratio will be less striking when greater amounts of data is stored.

Moreover, searching for a specific text in the XML string may provide some challenges in a non-XML enabled database system. Suppose a user searches for the word “culture” in the `Objective` attribute shown above. The search would match every single record in the table.

Given the advantages and disadvantages of the various ways of performing culture versioning the combination of relational and semi-structured data has been selected. Regardless of which approach has been chosen it has no consequences whatsoever for the business tier as all data access is handled transparently by the data tier.

5.2.6 Referential Integrity

In theory using Referential Integrity (RI) may seem like a good idea when designing a database because it enforces the relations between tables either by restricting deletes and inserts or cascading deletes. RI may prevent programmers and others who are tampering directly with the database from introducing an inconsistency into the database.

However, properly written applications will make sure that the referential integrity constraints are not violated and thus additional checks on the database level will only slow down performance. In large systems it may be possible to make such a complex topology of relations

that it becomes very difficult and in some cases impossible to back up or restore individual tables[7].

In the study planning system a prominent quantity of initializing data containing all the rules, types, periods *&c.* which are used in the system must be entered manually. Using RI would introduce a lot of constraints on the sequence in which the data is entered.

We find that business logic should not be built into the database by means of RI since it may restrict the possibilities of changing the business logic which is likely to change more often than the database itself. Therefore RI is not used in the database for the study planning system.

5.3 Main Architecture

In this section we present the main architecture of the study planning system. We have chosen to divide the system into the following three tiers[8]:

Tier Name	**Description**
Data Tier	Encompasses all interactions with the database i.e. creation, retrieval, alteration and deletion of data.
Business Tier	Encompasses rules, processes, workflow *&c.*
Presentation Tier	Encompasses all logic associated with the user interface.

This way of dividing the application is prevalent and is generally referred to as a 3-tier architecture. The implemented architecture complies with the requirements posed in section 4.4.4.

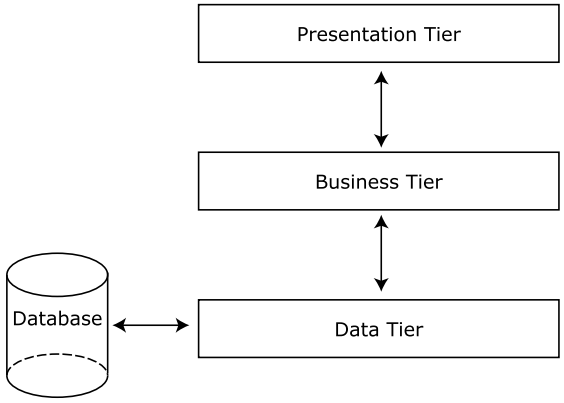


Figure 5.1: Illustration of the three tiers in the architecture.

There are numerous advantages of dividing the system up into tiers, the main points being[9]:

[7] http://www.mysql.com/doc/en/ANSI_diff_Foreign_Keys.html

[8] We have been inspired by the architectures presented in [3] and [22] and by the discussions made in chapter 10 of [16].

[9] The listed advantages (especially the "Reuse" and "Consistency" points) are closely related to componentizing the application which can said to be a direct part of dividing the application up into tiers.

- **Encapsulation** – plain interfaces hide irrelevant details from users of the interfaces. A case in point is that programmers working with the business tier do not have to possess any knowledge of how to interact with the database – they just use the interfaces provided by the data tier.

- **Adaptability** – the application is very adaptable to modified needs and changes in its environment. The presentation tier and business tier are for instance entirely unaffected by changes in the data tier, say, if the application changes to use another database system.

- **Reuse** – different parts of an application have similar functional needs. Two different parts of the presentation tier may have the need to present the fairly same set of data and may therefore reuse a common functionality in the business tier.

- **Consistency** – a specific functionality is handled in exactly one part of the application and is therefore handled consistently (a consequence of the "Reuse" point). Handling a certain business rule in several parts of an application involves the risk that the rule will be handled inconsistently at some point if the rule is not altered systematically everywhere in the application when it has to be handled differently.

From the above it appears that we have chosen not to divide the business tier further up into a user-oriented and a data-oriented tier as was suggested in section 4.4.4 as an option of further application division. The choice is deliberate and based on the fact that the system in its present version is only addressed to a single type of user agent, namely desktop client browsers, and the benefit of a further division is thus not sufficient. Provided that the system in the future is to be addressed to other types of user agents (like e.g. rich mobile clients and handheld PCs) it would most likely be worth to spend some resources splitting up the business tier further.

The division into tiers has the implication from a design point of view that the code, which manages the tasks in a certain tier, is organized within the same namespace. The three tiers in the study planning system have been organized in the following namespaces:

Tier Name	**Namespace**	**Described in**
Data Tier	`StudyPlanning.DAL`	Section 5.4
Business Tier	`StudyPlanning.Biz`	Section 5.5
Presentation Tier	`StudyPlanning.UI`	Section 5.6

As an example all the code that performs operations on the database is sited directly in the `StudyPlanning.DAL` namespace or in a namespace being subordinate hereto.

The three tiers are described in more detail in the sections stated in the above table. Please note, error handling in the three tiers is described in a common section, namely section 5.7.

5.4 Data Tier

The purpose of the data tier is to manage all interaction with the database. Any form of creation, retrieval, alteration and deletion of data in the database is thus handled by the data tier.

By encapsulating all database interactions within a separate tier one obtains among other things that the other parts of the application are not troubled with the quibblings and issues usually involved with interacting with a database. The other application parts just use the interfaces provided by the data tier.

The data tier first and foremost contains classes that represent the individual tables of the database. That is, a one-to-one mapping exists between the tables in the database and classes in the data tier as illustrated by figure 5.2.

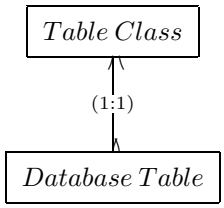

Figure 5.2: Illustration of the one-to-one mapping between a table class and a database table.

In addition to the table classes the data tier contains a number of common classes that support the table classes. These common classes are described in the subsections below.

The data tier is organized within the following namespace:

```
StudyPlanning.DAL
```

This namespace is divided up into a number of sub-namespaces. Confer appendix A for an overview of how the data tier is organized and brief descriptions of the individual classes in the tier.

The source code of the classes in the data tier can be found in chapter 1 in volume II.

5.4.1 Base Class

All the classes in the data tier that represent a table in the database inherit from a base class named `DbObject`. It is beneficial to use a base class seeing that it becomes very easy to add or change an aspect common to all of the table classes.

The `DbObject` class is fairly plain in that it simply creates a connection to the database. Hereby all subclasses have a database connection once instantiated.

5.4.2 Interaction with Stored Procedures

The table classes do not contain any inline SQL statements. We have chosen an approach where the table classes only operates on the database through stored procedures[10] as illustrated in figure 5.3.

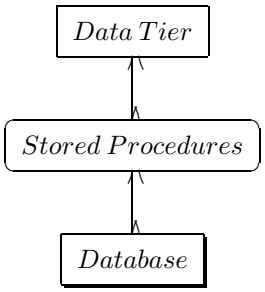

Figure 5.3: Illustration of the communication between data tier, stored procedures and the database.

One can speak of inserting a separate tier between the data tier and the database, however, we conceive the stored procedures as part of the database.

The reasons for the chosen approach are several[11]:

1. **Security:**
   (a) **Parameterized Queries**: Use of parameterized queries is enforced by the use of stored procedures. If one wants to invoke a stored procedure with some input it has to be done by means of input parameters. Similarly, as to output. By exclusively using parameterized queries the system is not vulnerable to security flaws like SQL and XPath injections. Use of parameterized queries thus complies with the security requirements posed in section 4.3.4.

   (b) **Fine-grained Authorization**: The majority of database systems, including SQL Server[12], provide security mechanisms that make it possible on a fine-grained level to restrict the use of a stored procedure. Use of stored procedures thus freely makes an extra level of security available.

2. **Reuse**: Two or more methods in a table class may have the need for the same query. Placing the query in a stored procedure allows for reuse of queries.

3. **Convenience**: T-SQL is an independent language and it seems convenient to have T-SQL statements placed in a self-contained media – the alternative being a cumbersome build-up of strings (holding the queries) in the table classes.

The drawback of the chosen approach is that not all database systems support stored procedures for which reason it may be more difficult to switch over to some database systems than others.

[10] A stored procedure is a set of SQL statements stored within the database in compiled form.
[11] Additional advantages of stored procedures is discussed at pages 255-257 and 352-355 in [16].
[12] http://msdn.microsoft.com/library/en-us/adminsql/ad_security_3whf.asp

In our implementation each individual stored procedure only operates on a single database table. The individual table class may interact with several stored procedures and several methods of a given table class may interact with the same stored procedure.

The T-SQL statements of the stored procedures can be found in chapter 2 in volume III.

5.4.3 Attribute Types

Every table class has public properties corresponding to the attributes of the table which the class represents.

These attributes are declared as one of the types listed in the following table:

Class Name	Description
`DalBool`	Models an attribute (of a database table) representing a boolean.
`DalDateTime`	Models an attribute (of a database table) representing date and time of day.
`DalFloat`	Models an attribute (of a database table) representing floating point data.
`DalGuid`	Models an attribute (of a database table) representing a globally unique identifier.
`DalInt`	Models an attribute (of a database table) representing an integer.
`DalString`	Models an attribute (of a database table) representing a string.
`DalStringLocalizable`	Models an attribute (of a database table) representing a localizable string. This class is described in more detail in section 5.4.4.

The types in the above table are referred to as "attribute types". We have been obliged to introduce the attribute types in the data tier due to the special `NULL` value that exists in databases. As is well known it is possible to assign a `NULL` value to an attribute of a database table in addition to assigning other values. A `NULL` value is assigned if the value is e.g. unknown or inapplicable[13]. The built-in types in the .NET Framework (e.g. `System.Int32` or `System.String`) can justly not have assigned `NULL` values to them and for this reason we have introduced the attributes types.

The attribute types are basically minor extensions of the built-in types – one of the extensions being the possibility of representing a `NULL` value. All the attribute types inherit from a base class named `DalType` as shown in figure 5.4. The `DalType` class contains a few properties and validation methods common to the attribute types.

5.4.4 The `DalStringLocalizable` Class

In section 5.2.5 we described how we have chosen to store semi-structured data in those attributes that need to be culture versioned i.e. localized.

[13] Interpretations of `NULL` values can be found at pages 239-240 in [27].

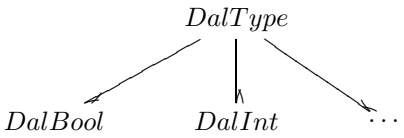

Figure 5.4: Illustration of how the various attribute types inherit from the `DalType` class.

The `DalStringLocalizable` class represents a text attribute that can be localized. The class is modelled as a hashtable – also known as a collection of key-and-value pairs. The key is the ID of a certain culture and the value is the text in that culture.

A localizable attribute may for instance be the name of a course:

```
DalStringLocalizable CourseName = new DalStringLocalizable(false);
```

, the `false` parameter indicating that the attribute may not be `NULL`. The `Add` method is used in order to localize the course name into a new culture:

```
Name.Add("da-DK", "Afløbssystemer");
Name.Add("en-GB", "Urban drainage systems");
```

In order to get the English name of a course one uses the following syntax:

```
string message;
message = "You have just signed up for course ";
message += Name["en-GB"];
```

Similarly, for other cultures.

5.4.5 The `DataLog` Class

As described in section 5.2.4 the attributes `Created`, `CreatedBy`, `Updated` and `UpdatedBy` occur on every single database table in the system on account of change tracking.

The `DataLog` class has been introduced as an obvious representation of the four attributes. Accordingly, each table class has a public `Log` property which is declared as a `DataLog` object.

The class has public properties corresponding to the afore-mentioned four attributes besides which a number of methods are offered in order to make it convenient and efficient for developers of table classes to work with the change tracking attributes.

5.4.6 Basic Methods

The various table classes most often implement one or more of the basic methods described in the table below.

Method Name	Description
`public void Create()`	Creates a new row in the current table based on the values of the properties of the current object.
`public void Retrieve()`	Retrieves a row from the current table using the value of property that represents the primary key of the table.
`public bool Update(...)`	Updates a row in the current table using the values of properties of the current object.
`public bool Delete()`	Deletes a row in the current table using the value of the property that represents the primary key of the table.

The listed methods correspond to the four basic statements in SQL as follows: `INSERT`, `SELECT`, `UPDATE` and `DELETE`. Invocation of one of the methods essentially leads to the execution of the corresponding SQL statement.

A great many of the table classes implement all four methods. Table classes representing a type table in most cases merely implement the `Retrieve` method. Naturally, the table classes implement other methods than the basic ones – e.g. several table classes implement methods that retrieve lists based on different criteria.

5.5 Business Tier

The purpose of the business tier is to manage how the system should function. The business tier interacts massively with the data tier and can be thought of as a servant to the presentation tier.

The most essential classes in the business tier are briefly described in the table below:

Class Name	Description
`Course`	Represents a course.
`Project`	Represents a project.
`Student`	Represents a student.
`StudyPlan`	Represents a study plan.
`StudyPlanCriterion`	Represents a study plan criterion i.e. an assembly of specifications on the basis of which the system should elaborate a study plan.
`StudyPlanElaborator`	Elaborates a study plan on the basis of a specified study plan criterion.
`CourseGrabber`	Grabs the courses in the "DTU Course Catalogue" and stores the courses in the database.

So perhaps most interestingly the business tier contains the algorithm that elaborates a study plan. Furthermore, the tier contains classes that:

- represent technical packages, technical lines, technical fields and specializations.

- handle security.
- provide localized text groups to the user interface.

The various parts of the business tier are described in chapter 6. The business tier is organized within the following namespace:

```
StudyPlanning.Biz
```

This namespace is again divided up into a number of sub-namespaces. Confer appendix B for an overview of how the business tier is organized and brief descriptions of the individual classes in the tier.

The source code of the classes in the business tier can be found in chapter 3 in volume II.

5.5.1 Base Class

Every class in the business tier inherits from a base class named `BizObject`. In the current version of the system the `BizObject` actually does not contain any properties or methods and does as such not add anything to its subclasses. Nevertheless, the `BizObject` has been introduced in order to easily support prospective common needs in the business tier.

5.6 Presentation Tier

The purpose of the presentation tier is to provide a user interface such that users can make use of the system. The presentation tier acts upon the user's actions and passes on user input to the business tier.

The presentation tier is implemented using ASP.NET i.e. the part of the .NET Framework for building web applications. Basically, the presentation tier is composed of a number of dynamic web pages – in this context so-called ASPX pages. The presentation code may be organized in many ways, however, ASP.NET supports a concept referred to as "code separation" and we have chosen that approach. Using the "code separation" approach, imperative code (e.g. C#) is conveniently separated from declarative code (e.g. HTML and XML) – in other words presentation code is separated from layout and design.

The individual ASPX page contains the HTML code, server controls and the like. In addition, the ASPX page inherits from a class in the so-called "code-behind" file associated to the ASPX page as illustrated in figure 5.5. The class in the "code-behind" file handles the events raised by the user on the ASPX page and manages the interaction with the business tier.

Using the "code separation" approach one can speak of inserting a separate tier between the presentation tier and the business tier, however, we conceive the "code-behind" classes as part of the presentation tier.

Several benefits apply to using code separation[14], the two most striking in our opinion being:

- **Layout Easier to Modify** – the layout and design can to a great extent be changed without the need of recompiling the presentation logic.
- **Division of Labour** – web designers can focus on the look and feel and developers can concentrate on the presentation logic. A favourable side effect moreover being that the presentation tier can be implemented in shorter time.

[14] Benefits of code separation are discussed e.g. at pages 305-306 in [16].

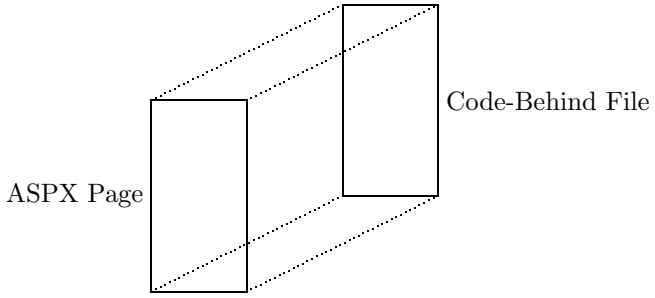

Figure 5.5: The individual ASPX page inherits from a class in its "code-behind" file.

The presentation tier is organized within the following namespace:

```
StudyPlanning.UI
```

Confer appendix C for an overview of the how the namespace is organized.

The source code of the presentation tier can be found in chapter 5 in volume II. The implemented user interface is described in chapter 8.

5.7 Error Handling

An important issue is how to handle errors. There is always the risk that errors may arise even though an application has been thoroughly tested and a profound handling of errors is therefore crucial.

Errors may arise in any of the application tiers. Chiefly, two types of errors can arise in the data tier:

Class Name	Description
`SqlException`	Exception that is thrown when the SQL Server returns a warning or an error.
`XmlException`	Exception that is thrown when an error occurs parsing an XML document.

We have introduced the `DalException` class as a common container for the exceptions that may arise in the data tier. Hereby, the business tier only has to deal with this single exception. In order to make tests on the different error types more convenient we operate with the following error codes in the `DalException` class:

Error Code	Description
4	**Validation error on a property**. For instance the value of an attribute, that is not allowed to be `NULL`, has not been set.
8	**Row does not exist**. For instance non-existing row has been attempted to be retrieved, updated or deleted.
12	**Row already exists**. For instance a row with an already existing primary key has been attempted to be created and the primary key constraint has thereby been violated.
16	**A severe error has occurred**. For instance the SQL server may be unreachable or an error has arisen parsing an XML document.

The error codes are arbitrarily chosen. The `DalException` class may be instantiated specifying either an `SqlException` or an `XmlException`.Recipients of a `DalException` may (in addition to the returned error code) get the exact error message by looking at the `Message` property of the thrown `DalException` object.

The recipients of thrown exceptions in the data tier are the classes in the business tier. The business tier may be able to cope with caught errors, however, some errors can not be handled and in such cases an exception must be thrown to the presentation tier. We have introduced the `BizException` class as a common container for unmanageable errors arisen in the business tier. A `BizException` is supposed to be thrown only if an error is severe and unmanageable. Finally, the presentation tier is to catch exceptions thrown by the business tier, provide a useful message to the user and possibly guide the user in what to do.

As a sum up we have introduced the following exceptions classes in the study planning application:

Exception Name	Description
`DalException`	**Represents an exception in the data tier**. When an error occurs in the data tier a `DalException` is thrown to the business tier. The business tier may be able to handle the error and proceed, however, in case of a severe error arisen in the data tier, the business tier is not able to continue and an error must be given to the user.
`BizException`	**Represents an exception in the business tier**. When an error occurs in the business tier a `BizException` is thrown to the presentation tier. A `BizException` is supposed to be thrown only if an error is severe and unmanageable and the current part of business tier is in no way able to continue. The presentation tier is based on a caught `BizException` responsible of presenting a useful message to the user.

Chapter 6

System Modules

In sections 5.3-5.6 we took a horizontal look by describing the data tier, business tier and presentation tier, respectively, in a general manner. In this chapter we will take a vertical look at the system.

We do so by describing select parts of the system referred to as system modules. As illustrated by figure 6.1, a system module is to be conceived as some entity or functionality transverse to the business and data tier possibly including a number of database tables.

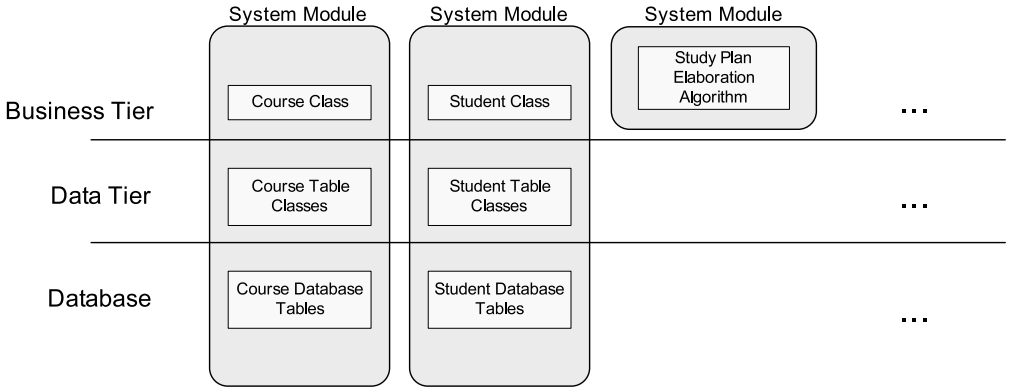

Figure 6.1: Illustration of how a system module is to be conceived.

In the description of the different system modules we will describe select parts of the database design and select parts of the business tier. We will refrain from describing the data tier and the stored procedures for each of the system modules for the following reasons:

1) The data tier and the stored procedures work more or less alike for all the different system modules.
2) Section 5.4 should have given adequate insight in the data tier and how it interacts with the database through stored procedures.

We will cover the following system modules (section number in brackets): “Courses” (6.1), “Projects” (6.2), “Students” (6.3), “Study Plans” (6.4), “Study Plan Criteria” (6.5), “Study Plan Elaboration” (6.6) and “Users and Security” (6.7).

6.1 Courses

The greater part of a student's study consists of taking courses – attend lectures, hand in assignments, take examination *&c.* For that reason courses form a weighty part of a study plan and are thus important with regard to study planning.

Courses are composed of much information and are cumbersome to deal with:

- courses are only taught in certain periods.
- teaching in courses is timetabled in certain modules.
- courses may be taught in several parts.
- courses may have complex interdependencies with other courses.
- *&c.*

A course is represented by the `Course` class in the business tier. The chief purpose of the methods in this class is to support the study plan elaboration algorithm.

Overview of this section:

- In subsection 6.1.1 select parts of the database design for courses are described.
- In subsection 6.1.2 a selection of methods provided by the `Course` class are described.

6.1.1 Database Design

In the table below some select database tables used to store course data are presented. Confer appendix E.3 for diagrams of all the database tables used for storing course information.

Table Name	Description
`CourseVersion`	This is the main table for storing course information, including e.g. course number and objective description.
`Course_Lecturer`	Stores the lecturers who are responsible for and teach the courses. The table maps the primary keys of the `CourseVerion` and the `Lecturer` tables.
`Course_Keyword`	Stores the keywords associated with courses by mapping the primary keys of the `CourseVersion` and `Keyword` tables.
`Course_Period`	Contains the periods in which course parts are taught.
`Course_Point`	Stores the credit points of course parts.
`Course_RecommendedPlacement`	This table contain the recommended placement for all courses for distinct study types.

Course Interdepencies

Recall from subsection 4.1.1 that course interdependencies must be specifiable in the form shown in figure 3.11.

The interdependencies between courses are specified by using the two tables `Course_RelationCourse` and `Course_RelationCourseItem` shown in the table below:

Table Name	Description
`Course_RelationCourse`	Each record in this table represents a disjunction list.
`Course_RelationCourseItem`	Entries in this table represent the items in the disjunction lists.

A course may have multiple entries in the `Course_RelationCourse` table meaning that it has a conjunction list of disjunctions lists since there is implicit conjunction between entries in the `Course_RelationCourse` table as illustrated in figure 6.2.

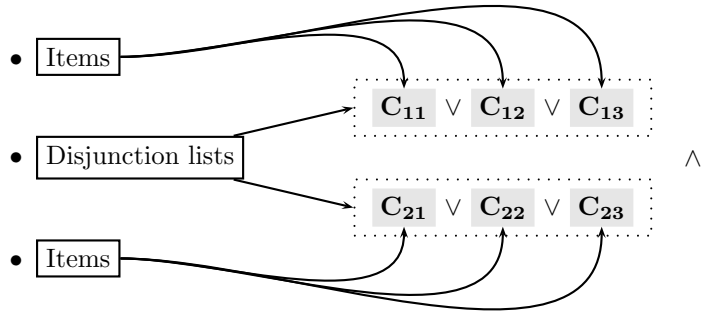

Figure 6.2: Illustration of the representation of course interdependencies.

6.1.2 Select Methods

In this section a selection of methods provided by the `Course` class are presented.

```
public static Guid[][] GetPointBlockingCourses(Guid courseVersion_ID)
```

Retrieves a list of point blocking courses represented by Course_IDs for a given CourseVersion_ID.

```
public static Guid[][] GetPrerequisites(
    Guid courseVersion_ID,
    PrerequisiteCourseType type)
```

Gets a list of prerequisite courses of the specified prerequisite type for the specified course version.

```
public static float GetWorkload(
    Guid courseVersion_ID,
    int part)
```

Retrieves the workload for a course part.

```
public static float[] GetRecommendedPlacement(
    Guid courseVersion_ID,
    int studyType_ID)
```

Retrieves the recommended placement for a course and studytype, expressed as a lower and upper limit of points. Confer sections 6.1.3 and 6.1.4.

```
public static Guid[][] GetKeywordMatchingCourses(
    string[] keywords,
    string culture_ID)
```

Retrieves a list of the course versions which match the specified keywords in the specified culture. The result is sorted such that courses matching the most keywords appear first in the resulting array.

In the following a selection of the methods generating chains of course prerequisites are presented:

```
public static Guid[][] GetPrerequisiteCourseCombinations(
    Guid courseVersion_ID,
    PrerequisiteCourseType type,
    bool chain)
```

Generates a list of prerequisite courses for a given course. The type of prerequisite is specified by the `type` parameter. The `chain` parameter specifies the depth of the prerequisite chains generated. If `TRUE` the complete chains will be generated such that the prerequisites of a prerequisite course are recursively included. If `FALSE` only the first level of prerequisites is generated.

```
public static Guid[][] SortCombinationsByComplexity(
    Hashtable passedGoingPlannedCourses,
    Guid[][] prerequisiteCombinations)
```

This method sorts the course chains by ascending complexity such that the shortest chains appear first in the result. The `passedGoingPlannedCourses` parameter is a hashtable containing all the courses which the student has passed at this point either for real or as estimated by the study plan elaborator. The method then removes the passed courses from the dependency chains and sorts the result.

6.1.3 Measurable Recommended Placements

To perform an automated study planning which takes the recommended placement of courses into consideration the recommended placements must be translated into a measurable quantity – such as credit points – for each study type. This can be achieved by associating the recommended placement with a point interval for each study type as shown in the example below:

Study Type	**Recommended Placement**	**Point Min**	**Point Max**
Bachelor of Science	4th to 5th semester	90	150
Master of Science	3rd to 4th semester	60	120

The example shows that before taking the course Bachelor of Science students should ideally have collected between 90 and 150 credit points whereas Master of Science students need to gather between 60 and 120 credit points to follow the placement recommendation of the course. Using credit points instead of semester numbers also has the advantage that the recommendation works even if a student has been delayed in his study which is not the case when using semester numbers.

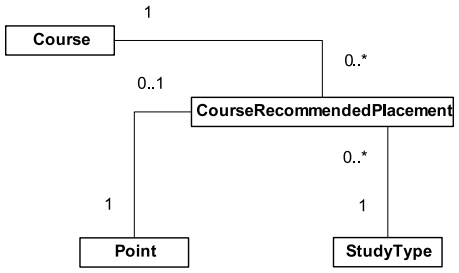

Figure 6.3: Logical model of the `Course` class and its associations to the `CourseRecommendedPlacement`, `StudyType` and `Point` classes.

Figure 6.3 shows a part of the logical model from figure 3.14 which has been extended to include the translation into point intervals. A course may have one or more recommended placements – one for each study type. Each `CourseRecommendPlacement` object is linked to a `Point` object which represents the recommended point interval for the given `StudyType` and `Course` objects.

The measurable recommended placement of courses is stored in the following database table:

Table Name	Description
`Course_RecommendedPlacement`	Contains the placement recommendation for all courses for each study type to which the course applies. The placement is specified by a `Point_ID` which refers to a point interval in the `Point` table. Alternatively, the placement is specified as a `RecommendedPlacementConcept_ID` (confer section 6.1.4).

6.1.4 RecommendedPlacementConcept

As mentioned in section 3.3.5 on page 20 the placement recommendation for a course may also be specified as a concept. The concept must be translated into a measurable quantity in order to perform an automated study planning.

The `RecommendedPlacementConceptStudyType` class is used to translate the recommended placement concepts into credit points (figure 6.4).

The translation depends on the study type as shown in the example below:

Study Type	Recommended Placement Concept	Point Min	Point Max
Bachelor of Science	At the end of the study	140	210
Master of Science	At the end of the study	200	300

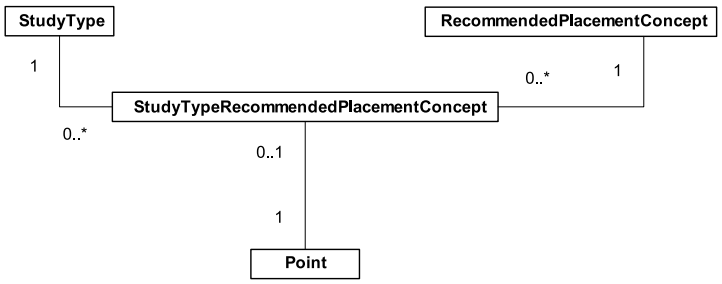

Figure 6.4: Logical model of the association between the `StudyType`, `RecommendedPlacementConcept`, `StudyTypeRecommendedPlacementConcept` and `Point` classes.

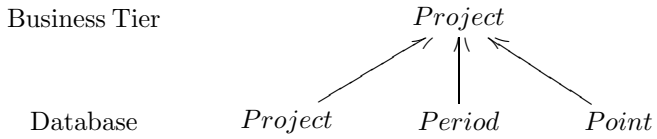
The recommended placement concepts associated with courses are stored in the following database tables:

Table Name	Description
`Course_RecommendedPlacement`	Contains the placement recommendation for all courses for each study type to which the course applies. If the placement is specified as a `Point_ID` the placement has been specifically specified (confer section 6.1.3). The placement may also be expressed as a `RecommendedPlacementConcept_ID` which refers to an entry in the `RecommendedPlacementConcept` table.
`RecommendedPlacementConcept`	Maps the recommended placement concepts into `Point_IDs` which refer to the `Point` table containing a point interval describing the placement recommendation.

6.2 Projects

As mentioned in section 3.4 a project may be e.g. a course with no timetabled teaching, the writing of a paper based on an assignment or a trainee job at a company.

A project is represented by the `Project` class in the business tier. In the database information concerning a project is stored in three different tables as illustrated in the following figure:



The `Project` class contains attributes which are distributed among the three entities in the database – `Project`, `Period` and `Point` as shown above. The `Project` class has the following attributes:

- Name and number of the project

- Type of the project
- Assessment type of the project
- Start date and end date of the project period
- Type of the project period
- Name of the project period
- Points assigned for the project

6.2.1 Database Design

Projects are stored in the following two database tables. The complete database diagrams for projects may be found in appendix E.14.

Table Name	Description
`Project`	The primary table for storing information concerning projects e.g. name of the project and project number.
`Project_Type`	Contains the possible project types in the system.

6.2.2 Methods

The `Project` class provides the following methods which may be performed on an instance of the class. The methods must primarily support the study plan elaborator:

public Guid Create()

Creates a new project by inserting data into the `Project`, `Period` and `Point` tables using the values of the current instance and returns the identification of the newly inserted row in the `Project` table.

public void Retrieve()

Retrieves information from the `Project`, `Period` and `Point` tables using the value of the `Project_ID` of the current instance. Data is also retrieved from the `ProjectType`, `PeriodType` and `AssessmentType` tables to get the names of all the types.

public float GetWorkload(Guid period_ID)

Gets the workload of the project represented by the current instance in a specific common period such as a 13-week period.

The `GetWorkload` method which retrieves the estimated workload of a project in a given period calculates the workload based on the workload intervals defined in the `StudyPlanCriterion_ProjectWorkload` table. The workload is calculated according to the following formula:

$$\sum_{i=1}^{n} \frac{o_i}{t_i} \cdot w_i$$

The variables are defined as follows:

n is the total number of workload intervals specified.

o is the number of overlapping days in the interval.

t is the total number of days in the interval.

w is the total workload specified for the interval.

Project				
w_1		w_2		w_3
a	b	c	d	e

In the example shown above the workload of a project has been specified by a student in three intervals of w_1, w_2 and w_3 points (confer also figure 4.8). The project is overlapped by a common period in sections b and c. Calculating the workload of the project in the common period is the performed as follows:

$$workload = \frac{|b|}{|a| + |b|} \cdot w_1 + \frac{|c|}{|c| + |d|} \cdot w_2 + \frac{0}{|e|} \cdot w_3$$

6.3 Students

A student is represented by the `Student` class in the business tier.

6.3.1 Database Design

In the table below some select database tables for storing information related to students are shown. The complete database diagrams containing all the database tables related to students may be found in appendix E.18.

Table Name	**Description**
`StudentVersion`	The main table for storing information about students such as study number and study type.
`Student_Course`	Contains the course parts which the student has signed up for.
`Student_Project`	Stores the projects for which the student has signed up.
`Student_StudyPlan`	This table contains the student's study plans.
`Student_StudyPlanCriterion`	Stores the student's study plans criteria.

6.3.2 Select Methods

The `Student` class provides the following methods which are used by the study plan elaboration function to determine which courses to schedule for the student:

```
public static float GetTotalPoints(Guid studentVersion_ID)
```

Retrieves the total sum of credit points which the student has obtained so far.

```
public static bool HasPassedCourse(
    Guid studentVersion_ID,
    Guid course_ID)
```

Determines whether a given student has passed a given course.

```
public static Guid[] GetPassedCourses(Guid studentVersion_ID)
```

Gets a list of the courses which the student has passed – i.e. courses where all course parts have been signed up for and passed.

```
public static CoursePart[] GetCourseParts(Guid studentVersion_ID)
```

For a given student this function retrieves the course parts for which the student has signed up – regardless of whether the student has passed the courses yet. This function provides the basis for the elaboration of a study plan.

6.4 Study Plans

As mentioned in section 3.9 a study plan is a list of periods, each containing the courses and projects which the student should sign up for. A study plan is represented by the `StudyPlan` and `StudyPlanPeriod` classes in the business tier.

6.4.1 Database Design

Elaboration of a study plan criterion results in a study plan which is stored in the database tables shown below. The complete database diagram for study plans may be found in appendix E.19.

Table Name	Description
`StudyPlan`	This is the main table for storing study plans.
`StudyPlan_Period`	Contains the periods in a study plan. A study plan may have arbitrarily many study plan periods. Since a project has its own individual period a study plan period may contain either a project or a number of course parts stored in the `StudyPlan_PeriodCourse` table.
`StudyPlan_PeriodCourse`	Stores the course parts which have been scheduled in a study plan period in a study plan.

6.4.2 Select Methods

The `StudyPlan` class provides the following methods:

public static DataTable GetStudyPlans(Guid student_ID)

Retrieves a list of a student's study plans and returns them in a DataTable object.

public static bool Delete(Guid studyPlan_ID)

Deletes the study plan identified by the supplied studyPlan_ID.

The `StudyPlanPeriod` class provides the following methods which all operate on the current instance. These methods are used by the study plan elaborator:

public void AddCoursePart(CoursePart cp)

Adds the specified course part to the current instance. The remaining workload is decremented and the available modules of study plan period are then updated to reflect the addition of the course part.

public void RemoveCoursePart(CoursePart cp)

Removes the specified course part from the current instance. Afterwards the remaining workload is adjusted and the modules occupied by the course part are added to the list of available modules to reflect the removal of this course part.

public bool ContainsCoursePart(CoursePart cp)

Determines whether the current instance contains the specified course part.

public CoursePart GetCoursePart(int index)

Retrieves the course part with the specified index from the list of course parts of the current instance. If no course part with the specified index exists a null value is returned.

6.5 Study Plan Criteria

A study plan criterion describes some requirements as to how a study plan should be elaborated as mentioned in section 4.1.7. In the business tier the study plan criterion is represented by the `StudyPlanCriterion` class.

6.5.1 Database Design

A study plan criterion consists of a set of database tables as shown in appendix E.20 which hold the student's preferences as to how a study plan should be elaborated. Some select tables are shown below:

Table Name	Description
`StudyPlanCriterion`	This is the main table for storing study plan criteria.
`StudyPlanCriterion_Keyword`	Contains the keywords selected by the student to match his interests.
`StudyPlanCriterion_Language`	Stores the languages which in which the student wants to be taught.
`StudyPlanCriterion_Lecturer`	This table contains the lecturers which the student does not want to be taught by.
`StudyPlanCriterion_Course`	Contains the courses which the student has either specifically selected or deselected.
`StudyPlanCriterion_ProjectWorkload`	Stores the workload of projects in user specified intervals. By default the workload is distributed evenly over the whole project period.

6.5.2 Select Methods

The data stored in the tables is retrieved through the data tier and manipulated by means of the following methods used exclusively by the study plan elaboration function:

```
public static int[] GetLanguages(Guid studyPlanCriterion_ID)
```

Retrieves a list of the languages which have been selected in a study plan criterion.

```
public static int[] GetLecturers(Guid studyPlanCriterion_ID)
```

Fetches a list of the lecturers which have been deselected in a study plan criterion.

```
public static int[] GetStudyTypes(Guid studyPlanCriterion_ID)
```

Gets the list of study types which the student has selected in a study plan criterion.

```
public static Guid[] GetKeywords(Guid studyPlanCriterion_ID)
```

Given a study plan criterion this method retrieves a list of the keywords which have been selected by the student.

```
public static float[] GetWorkload(
    Guid studyPlanCriterion_ID,
    Guid period_ID)
```

For a given study plan criterion and a period this method returns the desired workload expressed as an upper and a lower bound of credit points. If no specific workload demands have been set up for the period in question the general setting derived from the type of the specified period is used.

```
public static int[] GetModules(
    Guid studyPlanCriterion_ID,
    Guid period_ID)
```

Retrieves the available timetable modules for a given study plan criterion and period. If no timetable modules have been deselected in the specified period the universal setting deduced from the period type is used.

```
public static Guid[] GetSelectedCourses(
    Guid studyPlanCriterion_ID,
    [Guid period_ID])
```

For a given study plan criterion this function gets the courses which have been specifically selected. If a period is specified as well, only courses which have been selected in that particular period are returned.

```
public static Guid[] GetDeSelectedCourses(
    Guid studyPlanCriterion_ID,
    [Guid period_ID])
```

Retrieves the courses which have been deselected in a given study plan criterion. If a period is also specified, only courses which have been deselected in that specific period are returned.

```
public static Project[] GetProjects(
    Guid studyPlanCriterion_ID)
```

Retrieves a list of the projects which must be scheduled for this study plan criterion.

The methods `GetWorkload` and `GetModules` are a little special in that they will return either a specific or a general selection of workload or modules. For instance when calling the `GetWorkload` function supplying a study plan criterion and a period the function will first try to fetch a specific workload selection for the supplied period from the `StudyPlanCriterion_WorkloadPeriod` table (appendix E.20.3). If no such selection exists the period type is derived from the period by looking it up in the `Period` table (appendix E.11) and the general setting, which is created by default in a study plan criterion, for the period type is retrieved from the `StudyPlanCriterion_WorkloadPeriodType` table (appendix E.20.4).

The `GetProjects` function fetches the required projects from the `StudyPlanCriterion_ProjectWorkload` table (figure E.20.9). If the project originates from the technical package, the `TechnicalPackage_Project` table (figure E.24.4) is read in order to get details about placement of the project and its duration. If the project is determined by the study type the `StudyType_ProjectType` table (figure E.21.3) is read to get the details concerning the project. Using this information a `Project` object (section 6.2) is created for each project.

6.6 Study Plan Elaboration

The elaboration of a study plan is based on a Study Plan Criterion (SPC) (section 4.1.7) which describes the criteria for which to create a study plan. The elaboration of a study plan starts by retrieving the SPC and information about the student for which to elaborate a study plan.

In the SPC the student has the possibility of specifying a technical package (section 3.6) different from the one he is currently signed up for. If no technical package has been selected in the SPC, the student's current technical package is used. Additionally the student may select a technical line (section 3.7) in the SPC otherwise the technical line for which the student is signed up – if any – is used.

In the SPC some criteria are enforced generally for the whole study plan and some are specific for each period in the study plan. The general criteria are:

- Specifically selected or deselected courses.
- Selected language – at least one language must be selected.
- Deselected lecturers.
- Selected study types – at least one study type must be selected.
- Selected keywords.

Courses and projects which the student has already finished or signed up for previously are retrieved. According to the selected technical package and study type (section 3.8) the required projects are retrieved as well as the fundamental courses for the technical package.

Next step is to find the first possible period (section 3.14) in which to commence the scheduling process. The first possible period is the next period which has a start date greater than the current date.

Now the scheduling can begin. The following items are retrieved for each period:

- Mandatory courses for the technical package for this period.
- Mandatory courses for the technical package for previous periods which have not yet been passed.
- Optional courses for the technical package for this period.
- Courses which have been specifically selected/deselected in the given period.
- The desired workload and timetable modules for the period.

The courses for the period are scheduled by traversing the list of courses according to the priority rules in table 6.1 where 1 is the highest priority.

Priority	**Description**
1	Courses which have been specifically selected for the given period.
2	Mandatory courses for the technical package in the given period.
3	Mandatory courses for the technical package for previous periods.
4	Fundamental courses for the technical package.
5	Courses which have been specifically selected.
6	Prerequisite courses for a technical line where applicable.
7	Courses for a selected technical field where applicable.
8	Point giving courses for a specialization where applicable.
9	Supplementary courses for a specialization where applicable.
10	Optional courses for the technical package in the given period.
11	Keyword matching courses.

Table 6.1: Priorities according to which courses are selected.

Steps 6 through 9 of table 6.1 are bypassed until the technical package has been finished.

The priorities in table 6.1 have been chosen such that all mandatory courses are scheduled first as they must inevitably be passed and because they teach some fundamental skills which may be required by other courses. Next, courses which have been specifically selected by the student are scheduled. If a technical line has been selected the prerequisite courses for the technical line must have higher priority than the technical line itself. For specializations the point giving courses have higher priority than the supplementary courses. Courses matching one or more keywords selected by the student have the lowest priority in this context because the matching keyword(s) may describe only a small part of the course.

For each course the user specified constraints below are checked:

1. Is the course taught in one of the selected languages?
2. Is the course taught by a deselected lecturer?
3. Has the course been generally deselected?
4. Has the course been deselected in this period?
5. Is the recommended placement of the course satisfied?
6. Does the study type of the course match one of the selected study types?

However, none of the above-mentioned constraints except #4 are checked for mandatory courses in the technical package as well as fundamental courses since these courses must be scheduled no matter what.

If the constraints are satisfied the algorithm proceeds to course part scheduling where the individual parts of a course are scheduled. If part one of the course is taught in the period currently being scheduled and the timetable modules in which the course part is taught are available as well as the workload of the course part being less than the remaining workload of the period, the course part is scheduled. When a course part has been scheduled the available timetable modules and the remaining workload of the period must be updated.

If a course consists of multiple parts the first part may be placed in any period where the part is taught. However, as soon as part one has been placed the following parts must be scheduled in sequential order in the first possible periods hereafter as mentioned in section 3.3.1 on page 16. If for some reason a part cannot be scheduled according to this rule all parts of the course must be unscheduled and whole course must be moved to a new period if allowed.

6.6.1 Rescheduling

Whenever a course part has been unscheduled from a period it leaves an open space in the schedule and thus the period is not exploited optimally. To prevent this the period is rescheduled meaning that all possible course parts for the period are traversed again according to their priority until a suitable course part – if any – which will fill out the space has been found.

Prior to each rescheduling the state of the period is saved – i.e. the currently scheduled course parts for the period. This is done to avoid cyclic rescheduling where a course part is unscheduled (U in figure 6.5) from a period and hence a rescheduling (R in figure 6.5) is performed which schedules (S in figure 6.5) the same course part again which in turn is unscheduled again and so on. So before performing the actual rescheduling the current state is compared to all the previously stored states of the period. If a match is found the rescheduling is cancelled due to a cycle, otherwise the state is saved and the rescheduling is performed.

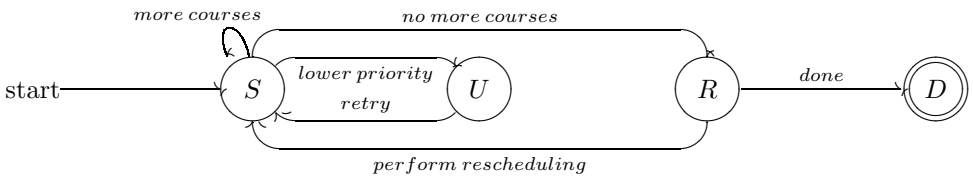


Figure 6.5: Illustration of a possible cyclic rescheduling.

6.6.2 Scheduling Course Chains

Some courses have dependencies to other courses (section 3.3.4, page 18) which in turn must be scheduled first if the student has specified so in the SPC. However, the prerequisite courses may also have dependencies to other courses thus introducing a chain of dependencies. When a course is to be scheduled its dependency chains are generated using a recursive function. Courses which have already been passed or signed up for in an earlier period are removed from the chains and the result is sorted by ascending complexity such that course chain containing the fewest courses appears at the beginning. The study plan elaborator then tries to schedule the courses in the dependency chain. If it fails it will retry using one of the other chains. If scheduling of all chains fail the course will not be scheduled if the chains contain mandatory prerequisites.

Scheduling Projects

Alongside the courses some projects must also be scheduled (sections 3.4 and 3.8). The required projects are stored in the SPC. Whenever a study plan period has been completed the elaborator algorithm determines whether a project should be scheduled at this point by comparing the accumulated number of credit points with the placement recommendation(s) of the project(s). If the project must be scheduled it is placed in its own individual study plan period which may overlap other study plan periods. The workload of the project in the overlapped periods is calculated from the specifications in the SPC (section 4.1.7 page 47).

6.6.3 Description of Flow

The diagram on page 97 shows how one period is scheduled as well as courses spanning multiple periods. Scheduling of projects or chains of prerequisite courses is not shown in the diagram. In the following the circled numbers like (1) refer to the correspondingly numbered transitions in the diagram.

The flow starts at (1) by fetching a course according to the priority rules in table 6.1. If the course has been generally deselected (2) in the SPC the flow returns to (A).

Next the language in which the course is taught is retrieved. If the course language is not among the languages selected in the SPC (4) the flow returns to (A) otherwise the lecturers teaching the course are fetched. If the course is taught by at least one lecturer who has been deselected in the SPC (6) the flow returns to (A) otherwise the recommended placement of the course if retrieved along with the estimated number of credit points for the period being

scheduled. If the recommended placement of the course is satisfied (9) the study types of the course are fetched else the algorithm returns to (A).

Provided that the course has one of the study types selected in the SPC (11) the course is checked for deselection in the given period. If the course has been deselected in the current period (13) it checked whether to allow moving the course to another period. If the course has not been deselected in the current period (12) part 1 of the course is retrieved.

If part 1 is taught in the current period the possible modules for the course part are fetched (15) otherwise the algorithm checks if it is permissible to move the course (14). If moving is allowed (17) the next period is retrieved and a cycle is performed using the transitions (12), (13) and (14) until a period in which the course is taught and is not deselected has been found (15). If no such period is found (19) the course part cannot be scheduled and the flow returns to (A).

If the modules in which the course part is taught are available (27) the workload of the course part is fetched. However, if the modules are not available (26) the algorithm checks whether any course parts with lower priority (confer table 6.1) have been scheduled in the given period. If this is the case (25) these course parts are unscheduled and the module check is repeated.

If no parts with lower priority have been scheduled or the unscheduling did not free the desired timetable modules the course part cannot be scheduled and the flow moves on (24) to checking whether the course part is greater than one. Since all course parts greater than one must be scheduled in the first periods in which they are taught all previous parts must be unscheduled (23) if the part is greater than one.

Unscheduling is done by updating the remaining workload for each period where a previous course part has been scheduled. The modules of the course part are added to the set of available modules and a rescheduling of the period is ordered since the removed course part now leaves behind a gap in the schedule. If moving the course is allowed (20) a new period is fetched and the algorithm then tries scheduling the course again in the new period starting from part one.

If the modules were available (27) the workload of the course part is retrieved along with the remaining workload of the current period. If the workload of the course part exceeds the remaining workload the course part cannot be scheduled (28) and the flow proceeds as if the modules were unavailable. If the remaining workload of the period allows the addition of the course part (29) the course part is scheduled, its modules are removed from the set of available modules and the remaining workload of the period is updated.

If there are more course parts (32) these must be scheduled as soon as possible. The next course part is fetched and and loop is performed (30) (31) until the first period has been found in which the course part is taught. Should there be no more course parts (33) the algorithm determines if the the desired workload for the period has been reached. If this is the case (34) scheduling the period has been finished otherwise (35) it is determined whether more courses are available in the period. If no more courses are available the algorithm returns (36) otherwise (37) the next course is fetched and the flow starts all over again.

6.7 Users and Security

The system is primarily intended to be used by students, however, the system has been designed in a way such that persons of all types (e.g. also lecturers) can be set up as a user in the system. A user is represented by the `User` class in the business tier.

A number of requirements were posed to the security of the system in the requirements specification:

- Admission to the system must be restricted.
- A user may only obtain access to those parts of system which the user has been authorized access to.
- The system must not be vulnerable to brute force attacks.
- A strict password policy should be managed by the system.

The posed security requirements are flexible in that no requirements are made with respect to data and no preferred approach of complying with the requirements has been stated.

We have chosen to implement a role-based security system making it possible to manage system policy in a general manner[1]. The security system operates with the following notions and relations:

1) A user has one or more roles.
2) A role has one or more permissions.

---

3) A user has one or more permissions.

Item 3) is a consequence of 1) and 2). The security system does not support assignment of a permission to the individual user. Both a role and a permission may give admission to various parts of the system. Usually, a permission allows for carrying out a specific action while a role gives a more general admission.

In the current version of the system a "Student" role and a convenient number of permissions have been created. However, the system could easily be configured also to have e.g. a "Lecturer" role and other permissions.

In the subsections below different parts of the security system are described, including authentication of users (section 6.7.2) and authorization (section 6.7.3).

6.7.1 Database Design

In the below table we provide a general view of the most important database tables used to store data by the user and security system. Confer appendix E.16 and E.25 for diagrams of the described tables.

[1] We have been inspired by [6], chapter 5 in [3] and not least [2].

Table Name	Description
`SecurityPermission`	Contains the permissions of the system.
`SecurityRole`	Contains the roles of the system.
`SecurityRole_SecurityPermission`	Stores a permission's membership of a role. The table maps the primary keys of the `SecurityPermission` and `SecurityRole` tables.
`User`	The main table for storing user information, including username and password.
`User_SecurityRole`	Stores a user's membership of a role. The table maps the primary keys of the `User` and `SecurityRole` tables.
`User_Login`	Stores rejected and approved authentication of a user. The data is used to prevent brute force attacks.
`User_PasswordHistory`	Stores a user's previous passwords. The data is used to enforce password policy.

6.7.2 Authentication

Authentication of users is a rather complex matter. The authentication module has to prevent brute force attacks, enforce users to renew password if it has expired *&c.* In order to gain insight into the many security checks made as part of the authentication process we refer to the authentication decision diagram in appendix D.

When a user attempts to log into the system by specifying a username and password, the presentation tier invokes the `Authenticate` method in the `User` class of the business tier:

```
public static AuthenticationResult Authenticate(
    string username,
    string password)
```

Authenticates the user having the specified username using the specified password. The method relies on the `UserAuthenticator` class (described below) which in fact performs the process of authentication.

The following classes support the authentication of users:

Class Name	Description
`AuthenticationResult`	Represents the result of a user authentication. The result specifies whether authentication of the user should be rejected or approved. In addition the result holds among other things a return code specifying the security case that lead to the rejection or approval.
`UserAuthenticator`	Supports authentication of a user. The `Authenticate` method of the class is the one that performs the security checks specified in the authentication decision diagram in appendix D – the method returns an `AuthenticationResult` object.

In the presentation tier we have made use of a module in ASP.NET called "Forms Authentication" which assists authentication of users and does a lot of troublesome work with cookies, encryption and the like behind the scenes[2]. Moreover, the module sees to it that any unidentified users are redirected to the login page.

6.7.3 Authorization

Authorization is the process of granting a user access to a particular part of the system or allowing the user to carry out some specific action. The presentation tier is responsible of performing the necessary authorization.

The `User` class in the business tier makes the following methods available to the presentation tier:

public static int[] GetRoles(Guid user_ID)

Retrieves a list of roles assigned to the specified user.

public static bool HasPermission(Guid user_ID, int permission_ID)

Checks whether the specified user has the specified permission. The method is based on the `GetRoles` method and the `HasPermission` method of the `Role` class.

public static bool HasRole(Guid user_ID, int role_ID)

Checks whether the specified user has the specified role. The method is based on the `GetRoles` method.

The methods in the `User` class are supported by the following methods in the `Role` class in the business tier:

public static int[] GetPermissions(int role_ID)

Retrieves a list of permissions assigned to the specified role.

public static bool HasPermission(int role_ID, int permission_ID)

Checks whether the specified role has the specified permission. The method is based on the `GetPermissions` method.

[2]The "Forms Authentication" module is described in chapter 9 in [2].

In a representative security check scenario, the presentation tier invokes the `HasPermission` or `HasRole` methods in the `User` class with a hard-coded identity of a role or a permission.

Chapter 7

Initial Data

A vast set of initial data must be present in the system before the elaboration of study plans can take place. In this chapter we describe how the system has been initialized with data.

Only course data can be entered automatically into the system as described in section 7.4. The remaining data is either not available in a sufficiently structured form or not available at all (subsections 7.1-7.3) and we have therefore had to create these data manually by means of SQL commands. The SQL commands for creating the initial data can be found in volume III, chapter 3.

7.1 Common Periods

All the common periods such as "3-week-periods" and "13-week-periods" have been created manually starting from the year 1998 to 2012. For passed and current periods the actual start and end dates have been used. For future periods the start and end dates have been estimated by using a calendar. The data for creating periods is shown in volume III, section 3.11.

7.2 Technical Packages

Technical packages are not available in a structured form like the courses. This implies that all technical packages have been entered into the database by hand. For M.Sc. students the technical packages have been created from 1998 to 2003 using the historical information[1]. From 2004 to 2011 the technical packages have been created as copies of the 2003 versions. However, the technical packages from 1998 to 2001 do not work due to some discontinued courses. For each year a new version of the technical package has been created – even if the technical package is unchanged compared to the previous year.

For B.Sc. students the history of technical packages is not available so the technical packages from 2004 to 2011 have been created as copies of the 2003 version. Furthermore most B.Sc.

[1] http://www.adm.dtu.dk/studieinformation/studinfo/fagpakkeskema/index_d.htm

technical packages start both in February and September so for these, two different technical packages have been created.

The "Mechanical Engineering" technical package for B.Sc. students differs from the other technical packages. The first part is common for all students but from the 3rd semester the technical package branches off as shown in figure 7.1.

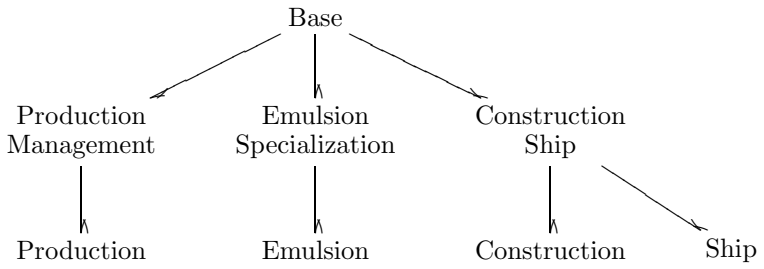

Figure 7.1: Illustration of how the "Mechanical Engineering" technical package branches off for various periods.

The technical packages have been created by the SQL listed in volume III section 3.21.

7.3 Miscellaneous Data

As was the case with technical packages, also technical lines, technical fields and specializations have been entered into the database by hand.

In the study planning system numerous type tables exist. These tables represent the type of another entity. For example the type of a `Period` is represented by the `PeriodType` table. Typically the type tables only contain a few rows which also have been entered by hand.

7.4 Course Data

The courses at DTU can be found in a structured format in the "DTU Course Catalogue"[2]. In order to initialize the study planning system with the current courses at DTU, a comprehensive component for grabbing the courses from the course catalogue has been implemented. The course grabbing component is represented by the `CourseGrabber` class in the business tier.

The HTML structure of the course catalogue web pages has been systematically analyzed and from the analysis a greater number of regular expressions have been prepared. The `CourseGrabber` component establishes a HTTP connection to the course catalogue and iterates through all the courses. For each course the various course data are grabbed by use of the regular expressions and finally the data are stored in the database.

Due to the fact that the specification of prerequisites and timetable modules of many courses is unstructured, inconsistent and in some cases actually erroneous this information had to be

[2]The "DTU Course Catalogue" is available at http://www.kurser.dtu.dk.

processed manually after grabbing the courses (confer volume III, chapter 4). The "*course part*" concept does not presently exist in the course catalogue[3] and we thus had to work in this concept in the creation of the afore-mentioned manual data.

[3]Only an indication of whether a course spans multiple terms is present which is not the same as course parts.

Chapter 8

User Interface

In this chapter we present principal aspects of the user interface[1]. We will refrain from describing the individual pages of the user interface as one can see these by own personal inspection of the system.

Section 8.1 presents the login page and section 8.2 describes the persistent navigation in the user interface. The support for different cultures in the user interface is briefly introduced in section 8.3.

8.1 Login Page

When an unidentified user requests for a page in the system, the user will be directed to a login page just as described in section 6.7.2.

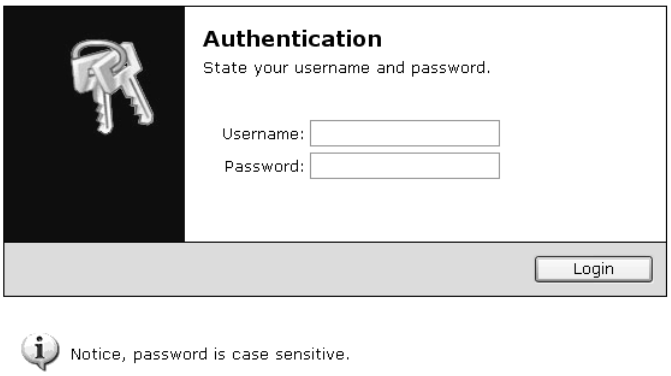

Figure 8.1: Screen shot of the login page.

Figure 8.1 shows a screen shot of the login page. The login page acts according to the requirements posed in section 4.2.2.

[1] We have been greatly inspired by the recommendations and the points presented in [17] in the preparation of the user interface.

8.2 Persistent Navigation

The user interface contains a persistent navigation i.e. a number of navigation elements that appear on every page in the user interface (apart from the login page). Partly, the persistent navigation is composed of primary and secondary navigation elements, partly, a so-called breadcrumb. Moreover, two utility links are also part of the persistent navigation. The constituent parts are described individually below.

8.2.1 Primary and Secondary Navigation

Every page (apart from the login page) contains a number of primary and secondary navigation elements. These elements appear in the same place on every page (namely at the top) and work in a consistent way.

The primary navigation elements consist in a number of main sections. In the current version of the system, the following main sections exist: "Study Planning", "Course Base", "Study Info" and "Control Panel". An illustration of the primary and secondary navigation elements are given in figure 8.2.

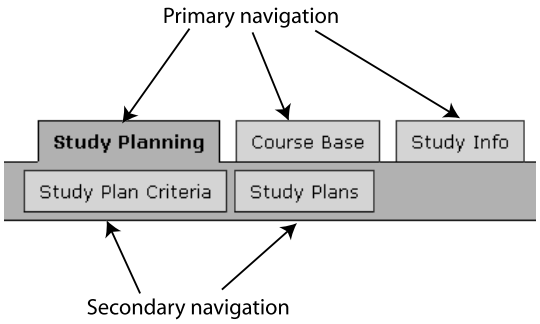

Figure 8.2: Illustration of the primary and secondary navigation elements.

8.2.2 Breadcrumb

As part of the persistent navigation we have included a breadcrumb (alias a "You are here" indicator). This a common aid used in many web applications and we quote from [17], page 74:

"One of the many ways navigation can counteract the Web's inherent 'lost in space' feeling is by showing me where I am in the scheme of things, the same way that a 'You are here' indicator does on the map in a shopping mall..."

Figure 8.3: Screen shot of the breadcrumb included as part of the persistent navigation in the user interface.

As it appears from figure 8.3, the breadcrumb shows the path from the Home page to the page the user is currently at. That is, the user is at all times ensured a general view hereby meeting one of the requirements posed in section 4.4.2.

8.2.3 Utilities

In the upper right corner of each page a link to the home page is present. Next to the home page link, a link for signing out of the system is present. These links are depicted in figure 8.4.

Figure 8.4: Screen shot of the breadcrumb included as part of the persistent navigation in the user interface.

8.3 Support for Different Cultures

The user interface has been culture versioned such that text strings, date formats *&c.* can be shown in various cultures. Currently, the Danish and British cultures are supported but other European cultures can easily be added.

When a user enters the login page, the culture of the user's session is set according to the user's preference. In any standard browser the user can configure his preferred languages – e.g. as illustrated in figure 8.5.

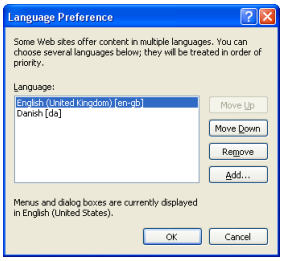

Figure 8.5: Screen shot of the "Language Preference" dialogue in Microsoft Internet Explorer.

If the user has not selected any of the supported languages, the culture is default set to the British culture.

Part III

System Test

Chapter 9

Test

In this chapter the testing of the system is described. First the overall test strategy will be introduced in section 9.1. Next, the testing of the system components will be presented in section 9.2 and finally an integration test may be found in section 9.3.

9.1 Test Strategy

The strategy for testing the system is first to perform a component test where each component is tested separately. In this context a component is considered an atomic module which does not depend on other components. When all components work satisfactorily the modules which rely on several components are tested in an integration test.

9.2 Component Test

The system consists of a number of components which have been tested separately to eliminate fundamental errors and mistakes. As mentioned in section 5.4 each component in the data tier controls the access to a specific database table. In order to conduct a thorough testing a test driver has been created for each component. The test driver consists of a web page which provides an interface to the component as well as its four operations `CREATE`, `READ`, `UPDATE` and `DELETE`. For example the test driver for the `PeriodType` class is shown in figure 9.1.

The creation of an entry may be tested by entering some data into the text fields and pressing the “Create” button. If the operation is successful the identification of the newly created entry is returned in the top field – the `PeriodType_ID` in this case. Retrieving an entry is done by entering the key of the entry in the key field – the `PeriodType_ID` in this case – and pressing the “Retrieve” button. The retrieved data is then displayed in the text fields. The data may then be changed and updated by pressing the “Update” button. Finally an entry may deleted by entering the key of the entry and pressing the “Delete” button. The “Reset” button blanks all the text fields.

If an error occurs it is displayed below the text fields. Figure 9.2 shows the error which occurs if an entry with the specified key was not found in the database.

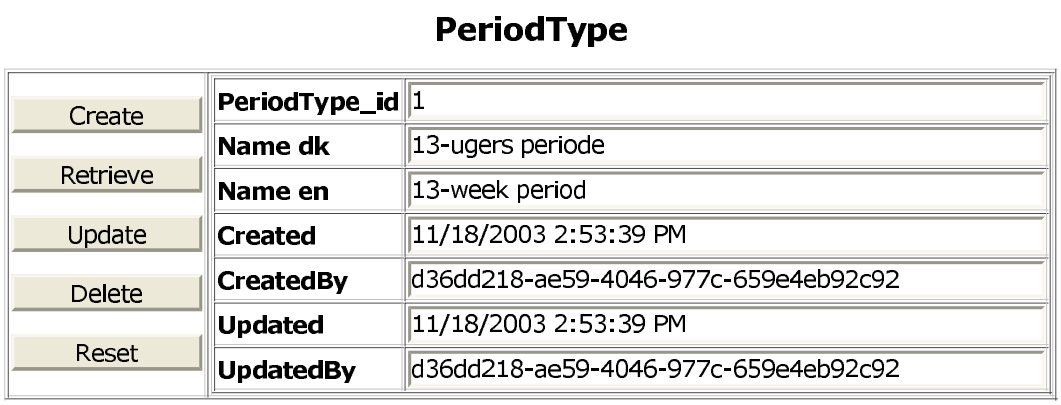

Figure 9.1: Illustration of the test driver for the `PeriodType` class.

```
StudyPlanning.DAL.DalException: Row does not exist. at
StudyPlanning.DAL.PeriodTypes.PeriodType.Retrieve() ...
```

Figure 9.2: Error from Data Tier.

For some components only the `RETRIEVE` operation has been implemented which is also the case for the above-mentioned `PeriodType` class. The test drivers have been prepared for all four operations, however, in this case pressing any other button than "Retrieve" or "Reset" will have no effect.

9.3 Integration Test

Some modules in the business tier like the `CourseGrab` module and the `StudyPlanElaborator` module also have test drivers similar to the one shown for the `PeriodType`. The test driver for the `StudyPlanElaborator` allows the user to enter the identification of a student and a study plan criterion. Pressing the "Elaborate" button starts the elaboration of a study plan and the result is displayed as shown in the following example:

The resulting study plan is validated manually by looking up the scheduled courses in the course catalogue [7] and by checking the various constraints.

Some of the following validations may fail if the student has specified conflicting demands in the study plan criterion. For example by specifically selecting a course which must be scheduled at some point and then deselecting the module(s) in which the course is taught for all periods. Furthermore, some validations may also fail due to the fact that not all constraints are checked for mandatory and fundamental courses in the technical package as mentioned in section 6.6.

A course must not be scheduled more than once

This constraint is easily checked by looking at the courses in the study plan.

A timetable module may only be used once in each period.

The test driver prints out the timetable modules occupied by each course in every period so this rule is checked by assuring that no timetable module occurs more than once in a period.

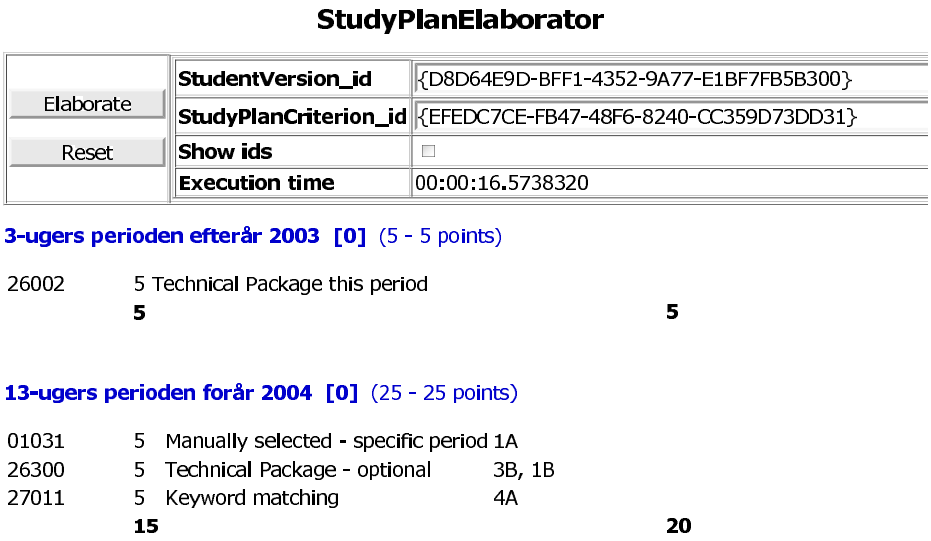

Figure 9.3: Illustration of the test driver for the `StudyPlanElaborator` class.

The desired maximum workload for a period must not be exceeded.

For each period the lower and upper bound of desired workload is printed along with the estimated number of points for the scheduled course parts in the period. The sum of points for scheduled course parts must be less than or equal to the upper bound of desired workload.

The parts of multiple part courses must be scheduled sequentially in ascending order and in the first possible period where the course part is taught.

Multiple part courses are displayed as *(Part#/Parts)* so checking that the course parts are scheduled in ascending order is quite trivial. Checking that course parts are scheduled in the first possible period requires a little more effort. If the next part is not scheduled in the first coming period it must be verified that the course part is not taught in that period as shown below where C_i is the course part i and P_j is period j:

$$\left.\begin{array}{c} scheduled(C_i, P_j) \wedge \neg scheduled(C_{i+1}, P_{j+k}) \Rightarrow \\ \neg taught(C_{i+1}, P_{j+k}) \end{array}\right\} i, j \in \mathbb{N}, k = \{1, 2, \ldots\}$$

Only courses being taught in the selected languages may be scheduled.

Check the language of the scheduled courses by looking them up in the course catalogue.

A course may only be scheduled if it has one of the selected study types.

Verify that the scheduled courses all have one of the selected study types.

Courses being taught by deselected lecturers may not be scheduled.

Consult the course catalogue for all scheduled courses and verify that they are not taught by one or more deselected lecturers.

Deselected courses may not be scheduled at all.

Verify that no deselected courses occur in the schedule.

Courses which have been specifically selected must be scheduled at some point.

Check that the specifically selected courses occur in the study plan.

Specifically deselected courses in a given period may not be scheduled in that period.

Verify that the deselected courses have not been scheduled in the specified period.

Courses which have been specifically selected in a given period must be scheduled in that period.

Check that the specifically selected courses have been scheduled in specified period.

Deselected modules may not be used.

Verify that no courses have been scheduled in deselected modules.

Courses must be scheduled according to their priority shown in table 6.1.

This validation requires that all the courses from the categories of the above-mentioned table are checked such that when multiple choices are available the course with the highest priority is scheduled. For each course in the study plan the test driver for `StudyPlanElaborator` prints the reason why the course has been scheduled here. Furthermore there is a logging function which displays all the decisions made by the `StudyPlanElaborator`

The results of the conducted tests will be further discussed in section 10.3.

Part IV

Summary

Chapter 10

Discussion

In this chapter we discuss whether the objectives of this thesis have been accomplished and whether the used approach have been appropriate.

The chapter is set out as follows:

- In section 10.1, different aspects of the conducted domain analysis and requirements specification are discussed.
- In section 10.2, discussions concerning the implemented system are made – including whether the posed requirements have been fulfilled.
- In section 10.3, a few comments are made on the conducted test.

Suggestions to future work are given in chapter 11.

10.1 Objectives

In the following two subsections we will discuss different aspects of the conducted domain analysis and requirements specification, respectively.

10.1.1 Domain Analysis

Analysis of the domain has been performed by applying an object-oriented approach and using UML class diagrams as a means of describing the entities of the domain. Compared to using a specification language[1] we find that in this context UML diagrams provide a more intuitive and two-dimensional description. UML class diagrams have been chosen over E/R (Entity Relationship) diagrams because class diagrams are object-oriented by nature and the representation of attributes in E/R is inconvenient when having anything but a few attributes.

The span of the domain analysis contains only B.Sc. students and M.Sc. students. It would have been relevant to include foreign M.Sc. students, Ph.D. students and food engineering students into the domain analysis as well, however, they have been omitted for reasons of

[1] For example RAISE

demarcation. We find that this omission is reasonable given the fact that B.Sc. and M.Sc. students represent the largest target group.

Considering the domain merely from the student's point of view has some drawbacks. Omitting lecturers from the domain analysis means that the any interactions between lecturer and student are not thoroughly analyzed. For example some lecturers offer individual projects which are not announced anywhere.

We find that the domain of study planning has been profoundly analyzed and that all relevant aspects of the domain as seen from the student's point of view have been carefully examined and documented.

10.1.2 Requirements Specification

As previously stated the requirements specification in chapter 4 is organized according to the principles expound in [18]. We value the concerned reference to be useful and we have found the prepared requirements specification to be a profitable "document" in the implementation of the study planning system.

Certainly, one could pose more detailed requirements, however, specifying too many details can be fatal to the creativity in the implementation of system and the possibility of handling problems in novel and slick ways is less likely.

We have chosen to describe the functional requirements in text. Another approach could have been to use UML "Use Case" diagrams which is also mentioned as an option in [18].

10.2 Implementation

In the subsections to come we discuss different aspects of the implemented study planning system. At first we verify whether the system complies with the posed requirements (section 10.2.1). Thereupon, the chosen architecture of the system is discussed (section 10.2.2).

Furthermore, we question:

- Is the system configurable? (section 10.2.3)
- Is the system extensible? (section 10.2.4)

The performance of the system is finally discussed in section 10.2.5.

10.2.1 Fulfillment of Requirements

In this subsection we discuss whether the implemented study planning system fulfills the requirements posed in the requirements specification presented in chapter 4.

Data Requirements

A systematic examination of the database design (appendix E) and the implemented data tier (section 5.4, appendix A) will show that the system is in fact capable of storing data as required in section 4.1. Moreover, section 5.1, subsections 5.2.3 and 5.4.4 and chapter 6 substantiate that claim.

Functional Requirements

Below we discuss whether the requirements posed with respect to functionality have been fulfilled.

- **Principal Requirement**
  As required, the system can be used by a web browser (confer section 5.6 and chapter 8). Into the bargain, a user interface to other types of user clients can relatively easy be provided in that all business and data logic have been separated from the web browser interface.
- **Elaboration of Study Plans**
  The system is indeed able to elaborate both correct as well as expedient study plans. This issue is discussed in section 10.3.
- **Various Management Functionality**
  As described in chapter 8, users are able to manage study plan criteria and view elaborated study plans by the user interface.
- **Restricted Admission *&c.***
  As expound in section 6.7, admission to the system is restricted, precautions are taken against brute force attacks and a strict password policy is managed. The requirements posed in section 4.2.2 are thus fulfilled.
- **Culture Versioning**
  Both the Danish and British cultures are supported by the current version of the system (confer subsections 5.2.5 and 5.4.4 and also chapter 8) and other European cultures can easily be added as exemplified in section 10.2.3.

In conclusion, the functional requirements have been fulfilled.

Quality Requirements

Below we discuss whether the requirements posed with respect to quality have been fulfilled.

- **Capacity**
  On account of the time available we have *not* carried out scalability tests and *only* verified that a subset of the initial capacity can be handled.
- **Performance**
  The system does indeed perform as required. The aspect of performance is discussed in section 10.2.5.
- **Usability**
  The posed usability requirements are difficult to measure, however, it is most likely that users can use the system without prior instruction. Moreover, the system only demands information from the user if the information cannot be derived from existing information.
- **Security:**
  - The system is not vulnerable to injections into the database as the data tier only interacts with the database using parameterized queries as explained in section 5.4.2.

  - Hackers cannot attack or make the system break down by exploiting buffer overruns as the system is based on the .NET Framework which offers a managed environment.
  - Nor does the system have a weak spot when it comes to URL tampering, content suction and script injections as countermoves have been made in that respect (confer section 5.6).
  - The transmission between the client and server is *not* done via the https protocol as it depends on a so-called SSL certificate which is not free of charge. However, this security aspect can easily be added later on.

- **Extensibility**
  The implemented system is indeed extensible. The aspect of extensibility is discussed in section 10.2.4.

In sum, except for the missing test of capacity, the implemented system can reasonably be said the meet all the posed quality requirements.

Other Requirements

Below we discuss whether the remaining requirements posed to the system have been fulfilled.

- **Legal Requirements**
  Because of the time available we have *not* taken specific initiative towards making the system fulfill the requirements posed in section 4.4.1.
- **User Interface Requirements**
  Referring to chapter 8 it is evident that the worked out user interface is in accordance with the requirements described in section 4.4.2.
- **Technical Requirements**
  As expound in section 5.6 the system only forwards output to the client (web browser) in a format such that a client, which complies to the standards specified in section 4.4.3, can actually use the system.
- **System Design and Programming**
  The system is based on a 3-tier architecture as expound in section 5.3 and object-oriented principles as it appears from e.g. sections 5.4-5.7. Consequently, the requirements made on system design and programming in section 4.4.4 have been fulfilled.

  Further discussion of the implemented architecture is given in section 10.2.2.
- **Documentation**
  The documentation requirements in section 4.4.5 can reasonably be said to have been fulfilled.

In short, apart from the legal requirements, the requirements posed in section 4.4 have as well been fulfilled.

10.2.2 Architecture

The various advantages of the chosen 3-tier architecture were enumerated in section 5.4. In addition to this we have a few comments based on our experience working with the architecture.

Undoubtedly, we felt it somewhat cumbersome to implement the data tier. However, the efforts proved to be rewarded as the business tier in many cases was very efficient to implement. Likewise, we found it a little incentive that the functionality of the system (e.g. elaborated study plans) were not visualized until late in the development process.

In addition the chosen approach concerning the one-to-one mapping between the table classes in the data tier and tables in the database, one could introduce a number of classes representing a join between two or more tables[2]. The disadvantage of a such insertion would be that several classes depend on the structure of a table and thus more dependencies have to be taken into account. The advantage would be less iterations in the business tier and possibly a better performing system.

10.2.3 Configurability

In the implementation of the system emphasis has been on configurability. The system is highly configurable which means that many changes may be performed without changing a single line of code. For example all types in the system are stored in database tables instead of being hard coded into the system modules. Some of the types used in the system are:

- Study Type
- Project Type
- Period Type
- ...

Adding a new study type to the system is thus merely a matter of inserting a few rows into the `StudyType` and `StudyTypeVersion` tables as well as other associated tables if applicable.

Representing course descriptions in a third language (besides Danish and English) such as German is as simple as inserting a new `<culture>` node in the XML string representing the course description (section 5.2.5).

If all the types had been hard coded into the system, development of the system might have been somewhat easier and quicker and the system would have worked just as well – maybe even faster since there would be less data to retrieve from the database. Using this approach, however, would have made the system quite static. Adding a new type would mean changing the code many places in the system with the possible risk of forgetting something. Introducing a new language might even require extension of some database tables as well as code alterations depending on the implementation.

In a dynamic world the requirements to a system (including a study planning system) are likely to change. A static system which requires the involvement of developers for making a small alteration is not desirable for the customer who has to pay for every change.

The approach used in the study planning system does not eliminate the need for code and database changes in order to cope with new requirements, but being configurable the number

[2] Alternatively, one could introduce a view in the database.

of changes needed is significantly lower when compared to hard coding. Hence the maintenance cost of the system is lower and the time-to-market is improved.

Section 11.1 describes how the system could be made even more configurable especially from the student's point of view.

10.2.4 Extensibility

We claim the system to be extensible and shall briefly exemplify how the system can be said to be so.

The utilized 3-tier architecture certainly conduces to the system being extensible. For instance, one can relatively easy support new types of user agents in that the new user interfaces can reuse the present logic in the business and data tiers. As another instance of flexibility, the system could bring new data sources into play (e.g. a web service) and the business tier would remain unaffected by this change in data strategy.

The fact that the system is implemented using an object-oriented programming language, namely C#, also makes the system extensible. As an example, existing classes can easily be extended with new methods and new classes can – without further ado – inherit from the present base classes.

In addition, the database design is made in a way such that data concerning distinct entities are stored in separate tables. Thereby, one can without exceptional difficulties alter data for an existing entity and introduce new entities.

10.2.5 Performance

Since study plans are to be elaborated online while the user is waiting, performance must be reasonable to an extent such that the user does not lose his patience. With the complexity of generating a study plan in mind most users will show understanding for the fact that the elaboration takes more than a few seconds.

Tests have shown that the elaboration of a study plan takes approximately 17 seconds on average[3]. Compared to the alternative of generating the study plans by an hourly running batch job, we find that a waiting time of 17 seconds is a small price to pay for an online generated result.

If the performance is not acceptable there are several possible ways of optimizing the performance of the study plan elaboration as described in the following.

Introducing Redundancy

Currently, the study plan elaboration algorithm uses some redundancy of data to improve performance. For example the elaborator often needs to know if a given course has already been scheduled when checking prerequisites and to prevent scheduling of the same course multiple times. This may be determined by performing a linear search through the preliminary study plan until the course has been found or the end of the study plan has been reached

[3]On an AMD Athlon XP 2000 with 256 MB RAM using Microsoft Internet Information Server 5.1, Microsoft SQL Server 2000 and version 1.1 of the .NET Framework

– hence the worst case runtime is $O(n)$ where n is the number of courses currently in the study plan. By using an additional hashtable for storing the courses which have already been scheduled the search time may be reduced to approximately $O(1)$ in most cases[4] The improvement in search time is significant even when taking the extra overhead of maintaining the redundant data into consideration.

For further optimization the prerequisite course chains for all courses could be generated and stored in the database for easy retrieval. Furthermore, the contents of the individual course part objects which are generated on the fly could be stored in a `CoursePart` table containing:

- Course_ID
- CourseVersion_ID
- Part number
- Total number of parts
- Workload for this part

Introducing Customized Retrieve Methods

The basic implementation of the 3-tier architecture implies that when retrieving data from a database table, all fields are retrieved regardless of whether only a single field is needed. If it appears that in for example 50% of the cases only two fields are needed, a new `RETRIEVE` operation dedicated to fetching only these two fields could improve performance. Special join modules which retrieve data from a join of multiple tables could also improve performance by eliminating the need for some loops of `RETRIEVE` operations.

10.3 Test

In the following subsections the test of the study planning system is discussed. First the correctness of the study plans generated by the study plan elaborator is discussed in section 10.3.1. Subsequently, it is discussed whether the elaborated study plans are appropriate for the students (section 10.3.2).

10.3.1 Correctness

The implementation of the study plan elaborator ensures that the generated study plans are correct. Being correct means that the resulting study plan does not violate the requirements specified in the corresponding study plan criterion and other constraints imposed by the university *&c.*

The integration test described in section 9.3 performed on a selection of different study plan criteria has shown that the resulting study plans are indeed correct. If a student has specified conflicting requirements in the study plan criterion he might not get the desired result, however, the study plan is still correct because the most restrictive of the conflicting requirements is used.

1) Select course 12345 which is taught in module 3A.
2) Deselect module 3A in all periods.

[4] http://msdn.microsoft.com/library/default.asp?url=/library/en-us/cpref/html/frlrfsystemcollectionshashtableclasscontainstopic.asp

If a student specifies the two above-mentioned requirements in a study plan criterion it may clearly be seen that the requirements are conflicting. However, since requirement 2) is the more restrictive the elaborator uses requirement 2) and thus requirement 1) cannot be satisfied in the resulting study plan.

10.3.2 Expediency

Even if a study plan satisfies all the requirements in the corresponding study plan criterion i.e. it is a correct study plan, it is not necessarily an expedient study plan for the student.

The priorities of courses (table 6.1) encourage scheduling of mandatory and fundamental courses at the beginning of the course of study. A study plan may thus contain one or more periods where exclusively fundamental courses have been scheduled. This may be perfectly correct, however, most students will not find such a study plan very appropriate due to the nature of these courses. Fundamental courses are often labour-intensive, they contain difficult material and hence the worst case scenario of scheduling for example five such courses in the same period would be overwhelming to the student.

Tests have shown that in practice, however, the study plan elaborator rarely schedules more than one or two fundamental courses in the same period unless a student has passed the middle of his study and has not yet taken any fundamental courses.

Section 11.1 describes some suggestions of how the system could be extended to allow the students to customize the priority of courses or to specify a maximum number of courses from each category of the priority table (table 6.1) which may be scheduled in one period.

Chapter 11

Future Work

In this chapter we present suggestions to future work to be done in continuation of this project.

11.1 More Individualized Configuration

Presently the system makes a number of predefined choices when elaborating a study plan for a given study plan criterion. Among these are the priority in which courses are selected in each period, when to check constraints and which alternatives to use when multiple choices are available.

Courses are selected according to the priorities listed in table 6.1 which aims at finishing the technical package and the fundamental courses as soon as possible whereas course matching keywords selected by the student have the lowest priority of all. However, some students might want a different priority which could be accomplished by introducing the possibility of customizing the priority rules.

Currently, some constraints such as deselected lecturers and preferred languages are not checked for mandatory courses in the technical package as well as fundamental courses. This setting has been selected because these courses must inevitably be finished if the student wants to obtain his degree. There is a time limit on the technical package which must be finished within four years after enrollment, however, if the student follows the recommended schedule the technical package will be finished after only two years and thus some students may want to exploit the given time limit a little more. Fundamental courses have no time limit except the student will not receive his degree until the fundamental courses have been passed. Being able to enable/disable checking of the various constraints for each group of courses might help the students to produce a more suitable study plan.

For many students fundamental courses are a necessary evil and are generally not regarded as particularly interesting. Some students want to finish the fundamental courses as soon as possible to get it over and done with. Others prefer taking one fundamental course every once in a while along with some other courses which match their interests. As the fundamental courses have a high priority in the elaboration of a study plan (confer table 6.1) chances are that several fundamental courses are scheduled in the same period which may not suit all

students. Therefore, as part of future work an option could be introduced as to how many fundamental courses may be scheduled in one period.

At present the elaboration of a study plan ensures that the mandatory courses in the technical package have been passed before any of the courses from a selected technical line are scheduled. Nonetheless, some students probably want to be able to bypass this restriction, so as a part of some future work this setting could be made user-customizable.

11.2 Representation of Skills

The specification of prerequisites is for some courses expressed as skills instead of or in addition to fixed course numbers. The following prerequisites are examples from the DTU course catalogue:

- Fundamental environmental chemistry.
- Knowledge of relational databases and query languages.
- Acquaintance with the so-called general linear model.
- Elementary knowledge of the SAS software system.

At first a specification of a skill seems be composed of the following constituents:

- **Level of skill**
  Superficial, elementary, extended, expert *&c.*
- **Type of skill**
  Knowledge of, acquaintance with, experience with *&c.*
- **The skill itself**
  A field, a method, a paradigm, a specific product *&c.*

However, further analysis is imperative and an independent project could be to evolve a way to represent skills. The elaboration of study plans would better reflect how study planning is executed in practice if skills could be specified in a well-defined way as part of a course prerequisite.

11.3 More Flexible Prerequisite Specifications

As mentioned in section 3.3.4 for some courses the dependencies are specified in the following form where $\mathcal{C}$ is the set of courses:

$$\left.\begin{array}{l}(a_1 \wedge b_1 \wedge \ldots \wedge z_1)\\ \vee\\ (a_2 \wedge b_2 \wedge \ldots \wedge z_2)\\ \vee\\ \ldots\end{array}\right\} a, b \ldots z \in \mathcal{C}$$

This form is presently not supported by the study planning system. However, for future work the above-mentioned specification could be implemented as part of allowing a more flexible specification of course interdependencies.

For some courses the specification of prerequisites allows that the course and its prerequisite courses are followed simultaneously. The following example where $\mathcal{C}$ is the set of courses illustrates this:

$$(a \wedge b \wedge \ldots \wedge z) \text{ at least simultaneously } \} \, a, b \ldots z \in \mathcal{C}$$

At the moment the elaboration of a study plan always assumes that prerequisites must be finished before scheduling a course, but as part of some future work this would be a possible extension.

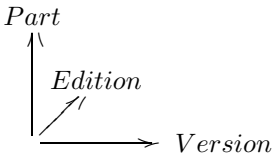
11.4 Editions of Courses

Many courses exist as regular and repeater courses created as two completely separate courses with different course numbers. There is no connection between the two courses apart from the course number which usually ends with a zero for the regular course and a one for the repeater course, however, this numbering convention cannot be taken for granted.

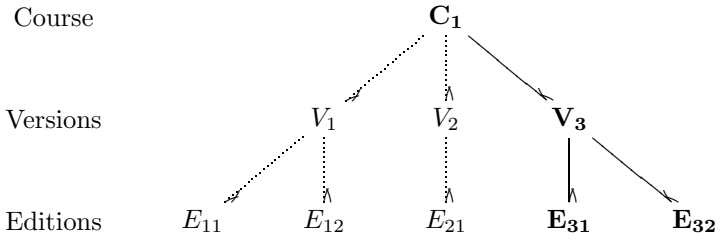
Since the courses are identical they should ideally be point blocking in relation to the same courses, but sometimes both courses are not specified as point blocking to other courses as the repeater course is typically forgotten. So when elaborating a study plan a course may be wrongfully scheduled due to errors in the course catalogue, however, this might also happen when performing the study planning by hand and hence it is not a problem inferred by the automated study planning.

To eliminate the need for regular and repeater courses a new dimension called *editions* could be added to the system. An edition is a variation of a course which inherits from the base course meaning that the connections between multiple instances can clearly be seen since they all inherit from the same base course. Editions differ from versions in that only one version of a course – i.e the newest – may be signed up for at any given time since it is used for retaining the history of a course whereas multiple editions of a course may coexist.

Adding the editions means that there are now three dimensions with respect to courses – parts, versions and editions.



The principles of versions and editions are illustrated in the following diagram:



In the diagram C_1 is a course. There are three versions of the course named V_1, V_2 and V_3. The versions V_1 and V_2 are obsolete as only the newest version of a course (V_3) is active. The editions inherit from the versions and hence the editions E_{11}, E_{12} and E_{21} have become obsolete since the versions from which they inherit are obsolete. So according to the example there is only one active version V_3 and two active editions E_{31} and E_{32}.

11.5 Taxonomy for Contents

Currently contents of courses are stated as keywords. However, this an unsophisticated and inadequate way of representing course contents. If a student e.g. specifies "physics" as one of his interests the search will not match a course having the keyword "quantum theory" even though quantum theory is a field within physics.

An independent project could be to devise how to represent course contents in a rich and intelligent way – a taxonomy for contents. In part prepare how to specify such a taxonomy and in part to map out the taxonomy itself. Having a well-developed taxonomy for course contents at disposal would make it possible to perform a more expedient study planning.

11.6 Student Grant

In order to maintain student grant the individual student may not be more than 12 months delayed in his studies compared with the prescribed time of study. In part for this reason the student has an interest in making continuous progress in his studies.

Receiving student grant for meeting living costs is an important aspect for the greater part of students and by it a factor which influences the study planning. A future version of the system could therefore profitably include student grant in the elaboration of study plans. As an alternative of specifying a desired workload in the different period types one could imagine a general option saying something like "Schedule courses and projects representing a workload which entitle me to maintain my student grant".

In fact the existing student grant rules are very accessible from an automated study planning point of view. To illustrate this we shall briefly describe the existing rules below taking Master of Science students as our starting point.

As mentioned elsewhere Master of Science students altogether have to collect 300 credit points in order obtain their degree. During his study a Master of Science student is entitled to receive at most 70 grants. The individual grant is not paid without further ado in that the student must have collected a fixed number of credit points (at least) in order to receive the grant in question. The precise point requirements for Master of Science students are given in the table below[1].

[1] Point requirements for the different study types are specified at 189-192 in [10].

Grant#	**Point**	**Grant#**	**Point**	**Grant#**	**Point**	**Grant#**	**Point**	**Grant#**	**Point**
1-12	0	24	42.5	36	97.5	48	157.5	60	225.0
13	2.5	25	47.5	37	102.5	**49**	**165.0**	61	230.0
14	5.5	26	52.5	38	107.5	50	170.0	62	237.5
15	7.5	27	57.5	39	112.5	51	175.0	63	242.5
16	10.0	28	62.5	40	115.0	52	180.0	64	250.0
17	15.0	29	67.5	41	120.0	53	185.0	65	255.0
18	17.5	30	70.0	42	125.0	54	190.0	66	262.5
19	20.0	31	75.0	43	130.0	55	195.0	67	270.0
20	25.0	32	80.0	44	135.0	56	202.5	68	275.0
21	30.0	33	85.0	45	142.5	57	207.5	69	280.0
22	35.5	34	90.0	46	147.5	58	212.5	70	287.5
23	40.0	35	95.0	47	152.5	59	217.5		

E.g. a Master of Science student must have collected at least 165 credit points in order to receive grant number 49. Similar points requirements apply to other study types. As is apparent from the example the existing rules is indeed measurable by disposition.

Chapter 12

Conclusion

In this thesis we have made a profound analysis of the domain of study planning from a student's point of view. Based on the analysis of the domain, a requirements specification has been prepared in which the necessary requirements for the implementation of a study planning system have been stated. A system which supports automated elaboration of study plans based on some criteria has been implemented – and can reasonably be said to fulfill the posed requirements.

The implemented system is among other things highly configurable and based on a 3-tier architecture. Furthermore, the system has been initialized with a complete set of the data related to study planning and not just an extract hereof.

Tests of the system have been conducted and discussions of the test results have been made. In addition we have also made discussions concerning different aspects of the implemented system. Finally, suggestions for future work to be done in continuation of this thesis have been presented.

We find that the resulting study planning system is a great step towards making it easier for students to plan their studies more carefully and more than just a couple of terms ahead. Hopefully, in the future some students will benefit from our efforts.

Part V

Appendices

Appendix A

Overview of the `StudyPlanning.DAL` Namespace

In this appendix an overview of the `StudyPlanning.DAL` namespace is provided. The namespace constitutes the data tier.

The appendix is organized as follows:

- Section A.1 describes the classes that are organized in the root of the `StudyPlanning.DAL` namespace.
- Section A.2 describes the classes that are organized within a subnamespace to the `StudyPlanning.DAL` namespace.

A.1 Root Classes

A number of classes are organized directly in the root of `StudyPlanning.DAL` namespace:

This section is organized as follows:

- Subsection A.1.1 describes the classes that represent attributes of database tables.
- Subsection A.1.2 describes the classes that represent database tables.

A.1.1 Attribute Classes

The classes listed in the below table represent attributes of database tables. All of the listed classes are organized in the root of the `StudyPlanning.DAL` namespace.

Class Name	Description
DalType	Base class for the classes that model a single attribute of a database table.
DalBool	Models an attribute (of a database table) representing a boolean.
DalDateTime	Models an attribute (of a database table) representing date and time of day.
DalFloat	Models an attribute (of a database table) representing floating point data.
DalGuid	Models an attribute (of a database table) representing a globally unique identifier.
DalInt	Models an attribute (of a database table) representing an integer.
DalString	Models an attribute (of a database table) representing a string.
DalStringLocalizable	Models an attribute (of a database table) representing a localizable string.
DataLog	Represents the attributes Created, CreatedBy, Updated and UpdatedBy which occur on every single table in the database.

A.1.2 Table Classes

The classes listed in the below table represent tables in the database. All of the listed classes are organized in the root of the StudyPlanning.DAL namespace.

Class Name	Description
`Assessment`	Represents the “Assessment” table in the database.
`AssessmentType`	Represents the “AssessmentType” table in the database.
`ContactData`	Represents the “ContactData” table in the database.
`ContactDataType`	Represents the “ContactDataType” table in the database.
`Department`	Represents the “Department” table in the database.
`Gender`	Represents the “Gender” table in the database
`Grade`	Represents the “Grade” table in the database.
`Keyword`	Represents the “Keyword” table in the database.
`Language`	Represents the “Language” table in the database.
`Lecturer`	Represents the “Lecturer” table in the database.
`Module`	Represents the “Assessment” table in the database.
`Period`	Represents the “Period” table in the database.
`Project`	Represents the “Project” table in the database.
`ProjectType`	Represents the “ProjectType” table in the database.
`Text`	Represents the “Text” table in the database.
`Weekday`	Represents the “Weekday” table in the database.

A.2 Subnamespaces

The `StudyPlanning.DAL` namespace has been divided into the subnamespaces stated in the below table.

Each namespace contains classes that operate on database tables storing data concerning a specific part of the system e.g. the `StudyPlanning.DAL.Courses` namespace contains classes that operate on database tables storing course data.

Namespace	Described in
StudyPlanning.DAL.Courses	Section A.2.1
StudyPlanning.DAL.PeriodTypes	Section A.2.2
StudyPlanning.DAL.RecommendedPlacementConcepts	Section A.2.3
StudyPlanning.DAL.SecurityRoles	Section A.2.4
StudyPlanning.DAL.Specializations	Section A.2.5
StudyPlanning.DAL.Students	Section A.2.6
StudyPlanning.DAL.StudyPlanCriteria	Section A.2.7
StudyPlanning.DAL.StudyPlans	Section A.2.8
StudyPlanning.DAL.StudyTypes	Section A.2.9
StudyPlanning.DAL.TechnicalFields	Section A.2.10
StudyPlanning.DAL.TechnicalLines	Section A.2.11
StudyPlanning.DAL.TechnicalPackages	Section A.2.12
StudyPlanning.DAL.Users	Section A.2.13

A.2.1 StudyPlanning.DAL.Courses

The StudyPlanning.DAL.Courses namespace contains classes that operate on database tables storing data concerning **courses**.

The below table describes the classes contained in the namespace.

Class Name	Description
`Course`	Represents the "Course" table in the database.
`CourseGrab`	Represents the "CourseGrab" table in the database.
`CourseVersion`	Represents the "CourseVersion" table in the database.
`Department`	Represents the "Course_Department" table in the database.
`Keyword`	Represents the "Course_Keyword" table in the database.
`Lecturer`	Represents the "Course_Lecturer" table in the database.
`Period`	Represents the "Course_Period" table in the database.
`PeriodModule`	Represents the "Course_PeriodModule" table in the database.
`PeriodModuleItem`	Represents the "Course_PeriodModuleItem" table in the database.
`Point`	Represents the "Course_Point" table in the database.
`RecommendedPlacement`	Represents the "Course_RecommendedPlacement" table in the database.
`RelationCourse`	Represents the "Course_RelationCourse" table in the database.
`RelationCourseItem`	Represents the "Course_RelationCourseItem" table in the database.
`StudyType`	Represents the "Course_StudyType" table in the database.
`StudyTypeCategory`	Represents the "Course_StudyTypeCategory" table in the database.

A.2.2 `StudyPlanning.DAL.PeriodTypes`

The `StudyPlanning.DAL.PeriodTypes` namespace contains classes that operate on database tables storing data concerning **period types**.

The below table describes the classes contained in the namespace.

Class Name	Description
`PeriodType`	Represents the "PeriodType" table in the database.
`Module`	Represents the "PeriodType_Module" table in the database.

A.2.3 `StudyPlanning.DAL.RecommendedPlacementConcepts`

The `StudyPlanning.DAL.RecommendedPlacementConcepts` namespace contains classes that operate on database tables storing data concerning **recommended placement concepts**.

Class Name	Description
`RecommendedPlacementConcept`	Represents the "RecommendedPlacementConcept" table in the database.
`StudyType`	Represents the "RecommendedPlacementConcept_StudyType" table in the database.

A.2.4 StudyPlanning.DAL.SecurityRoles

The StudyPlanning.DAL.SecurityRoles namespace contains classes that operate on database tables storing data concerning **security roles** (user roles).

The below table describes the classes contained in the namespace.

Class Name	Description
SecurityPermission	Represents the "SecurityRole_SecurityPermission" table in the database.

A.2.5 StudyPlanning.DAL.Specializations

The StudyPlanning.DAL.Specializations namespace contains classes that operate on database tables storing data concerning **specializations**.

The below table describes the classes contained in the namespace.

Class Name	Description
Specialization	Represents the "Specialization" table in the database.
Course	Represents the "Specialization_Course" table in the database.
SpecializationVersion	Represents the "SpecializationVersion" table in the database.

A.2.6 StudyPlanning.DAL.Students

The StudyPlanning.DAL.Students namespace contains classes that operate on database tables storing data concerning **students**.

The below table describes the classes contained in the namespace.

Class Name	Description
Student	Represents the "Student" table in the database.
Course	Represents the "Student_Course" table in the database.
Department	Represents the "Student_Department" table in the database.
Project	Represents the "Student_Project" table in the database.
StudentVersion	Represents the "StudentVersion" table in the database.
StudyPlan	Represents the "Student_StudyPlan" table in the database.
StudyPlanCriterion	Represents the "Student_StudyPlanCriterion" table in the database.

A.2.7 StudyPlanning.DAL.StudyPlanCriteria

The StudyPlanning.DAL.StudyPlanCriteria namespace contains classes that operate on database tables storing data concerning **study plan criteria**.

The below table describes the classes contained in the namespace.

Class Name	Description
StudyPlanCriterion	Represents the "StudyPlanCriterion" table in the database.
Course	Represents the "StudyPlanCriterion_Course" table in the database.
CoursePeriod	Represents the "StudyPlanCriterion_CoursePeriod" table in the database.
Keyword	Represents the "StudyPlanCriterion_Keyword" table in the database.
Language	Represents the "StudyPlanCriterion_Language" table in the database.
Lecturer	Represents the "StudyPlanCriterion_Lecturer" table in the database.
ProjectPeriodPoint	Represents the "StudyPlanCriterion_ProjectPeriodPoint" table in the database.
StudyType	Represents the "StudyPlanCriterion_StudyType" table in the database.

The namespace is further divided up into the following two subnamespaces:

- StudyPlanning.DAL.StudyPlanCriteria.WorkloadPeriods (described below)
- StudyPlanning.DAL.StudyPlanCriteria.WorkloadPeriodTypes (described below)

StudyPlanning.DAL.StudyPlanCriteria.WorkloadPeriods

The below table describes the classes contained in the namespace.

Class Name	Description
WorkloadPeriod	Represents the "StudyPlanCriterion_WorkloadPeriod" table in the database.
Module	Represents the "StudyPlanCriterion_WorkloadPeriod_Module" table in the database.

StudyPlanning.DAL.StudyPlanCriteria.WorkloadPeriodTypes

The below table describes the classes contained in the namespace.

Class Name	Description
WorkloadPeriodType	Represents the "StudyPlanCriterion_WorkloadPeriodType" table in the database.
Module	Represents the "StudyPlanCriterion_WorkloadPeriod-Type_Module" table in the database.

A.2.8 StudyPlanning.DAL.StudyPlans

The StudyPlanning.DAL.StudyPlans namespace contains classes that operate on database tables storing data concerning **study plans**.

The below table describes the classes contained in the namespace.

Class Name	Description
StudyPlan	Represents the "StudyPlan" table in the database.
Period	Represents the "StudyPlan_Period" table in the database.
PeriodCourse	Represents the "StudyPlan_PeriodCourse" table in the database.

A.2.9 StudyPlanning.DAL.StudyTypes

The StudyPlanning.DAL.StudyTypes namespace contains classes that operate on database tables storing data concerning **study types**.

The below table describes the classes contained in the namespace.

Class Name	Description
StudyType	Represents the "StudyType" table in the database.
ProjectType	Represents the "StudyType_ProjectType" table in the database.
StudyTypeVersion	Represents the "StudyTypeVersion" table in the database.
TechnicalLine	Represents the "StudyType_TechnicalLine" table in the database.

A.2.10 StudyPlanning.DAL.TechnicalFields

The StudyPlanning.DAL.TechnicalFields namespace contains classes that operate on database tables storing data concerning **technical fields**.

The below table describes the classes contained in the namespace.

Class Name	Description
TechnicalField	Represents the "TechnicalField" table in the database.
Course	Represents the "TechnicalField_Course" table in the database.
TechnicalFieldVersion	Represents the "TechnicalFieldVersion" table in the database.

A.2.11 StudyPlanning.DAL.TechnicalLines

The `StudyPlanning.DAL.TechnicalLines` namespace contains classes that operate on database tables storing data concerning **technical lines**.

The below table describes the classes contained in the namespace.

Class Name	Description
`TechnicalLine`	Represents the "TechnicalLine" table in the database.
`PrerequisiteCourse`	Represents the "TechnicalLine_PrerequisiteCourse" table in the database.
`PrerequisiteTechnicalPackage`	Represents the "TechnicalLine_PrerequisiteTechnicalPackage" table in the database.
`PrerequisiteTechnicalPackageCourse`	Represents the "TechnicalLine_PrerequisiteTechnicalPackageCourse" table in the database.
`Specialization`	Represents the "TechnicalLine_Specialization" table in the database.
`TechnicalField`	Represents the "TechnicalLine_TechnicalField" table in the database.
`TechnicalLineVersion`	Represents the "TechnicalLineVersion" table in the database.

A.2.12 StudyPlanning.DAL.TechnicalPackages

The `StudyPlanning.DAL.TechnicalPackages` namespace contains classes that operate on database tables storing data concerning **technical packages**.

The below table describes the classes contained in the namespace.

Class Name	Description
TechnicalPackage	Represents the "TechnicalPackage" table in the database.
FundamentalCourse	Represents the "TechnicalPackage_FundamentalCourse" table in the database.
FundamentalCourseItem	Represents the "TechnicalPackage_FundamentalCourseItem" table in the database.
Period	Represents the "TechnicalPackage_Period" table in the database.
PeriodCourse	Represents the "TechnicalPackage_PeriodCourse" table in the database.
PeriodCourseItem	Represents the "TechnicalPackage_PeriodCourseItem" table in the database.
PeriodOptionalCourse	Represents the "TechnicalPackage_PeriodOptionalCourse" table in the database.
Project	Represents the "TechnicalPackage_Project" table in the database.
TechnicalPackageVersion	Represents the "TechnicalPackageVersion" table in the database.

A.2.13 StudyPlanning.DAL.Users

The StudyPlanning.DAL.Users namespace contains classes that operate on database tables storing data concerning **users**.

The below table describes the classes contained in the namespace.

Class Name	Description
User	Represents the "User" table in the database.
Login	Represents the "User_Login" table in the database.
PasswordHistory	Represents the "User_PasswordHistory" table in the database.
SecurityRole	Represents the "User_SecurityRole" table in the database.

Appendix B

Overview of the `StudyPlanning.Biz` Namespace

In this appendix an overview of the `StudyPlanning.Biz` namespace is provided. The namespace constitutes the business tier.

The appendix is organized as follows:

- Section B.1 describes the classes that are organized in the root of the `StudyPlanning.´Biz` namespace.
- Section B.2 describes the classes that are organized within a subnamespace to the `StudyPlanning.Biz` namespace.

B.1 Root Classes

The classes described in the below table are organized directly in the root of `StudyPlanning.Biz` namespace.

Class Name	Description
Course	Represents a course.
CoursePart	Represents a course part.
Lecturer	Represents a lecturer.
Specialization	Represents a specialization.
Student	Represents a student.
StudyPlan	Represents a study plan.
StudyPlanCriterion	Represents a study plan criterion.
StudyPlanElaborator	Supports elaboration of a study plan.
TechnicalField	Represents a technical field.
TechnicalLine	Represents a technical line.
TechnicalPackage	Represents a technical package.
TextItem	Represents a text string.
User	Represents a user.
UserAuthenticator	Supports authentication of a user.
AuthenticationResult	Represents the result of a user authentication.
BizObject	Base class in the business tier. Other classes in the business tier inherit from the BizObject class (some, however, only indirectly).
BizException	Represents an error in the business tier.
BizStringLocalizable	Represents a localizable string.
BizType	Base class for types specific to the business tier. Presently only the BizStringLocalizable class inherits from the BizType class.

B.2 Subnamespaces

The StudyPlanning.Biz namespace has been divided into the subnamespaces stated in the below table.

Namespace	Described in
StudyPlanning.Biz.Course.Grab	Section B.2.1
StudyPlanning.Biz.Security	Section B.2.2

B.2.1 StudyPlanning.Biz.Course.Grab

The StudyPlanning.Biz.Course.Grab only contains the CourseGrabber class as described below.

Class Name	Description
`CourseGrabber`	Grabs courses from the DTU course catalogue at http://www.kurser.dtu.dk/.

B.2.2 `StudyPlanning.Biz.Security`

The `StudyPlanning.DAL.PeriodTypes` namespace contains classes related to security.

The below table describes the classes contained in the namespace.

Class Name	Description
`Password`	Represents a password of a user.
`Role`	Represents a user role.

Appendix C

Overview of the `StudyPlanning.UI` Namespace

In this appendix an overview of the `StudyPlanning.UI` namespace is provided. The classes within the namespace along the various ASPX pages constitute the presentation tier.

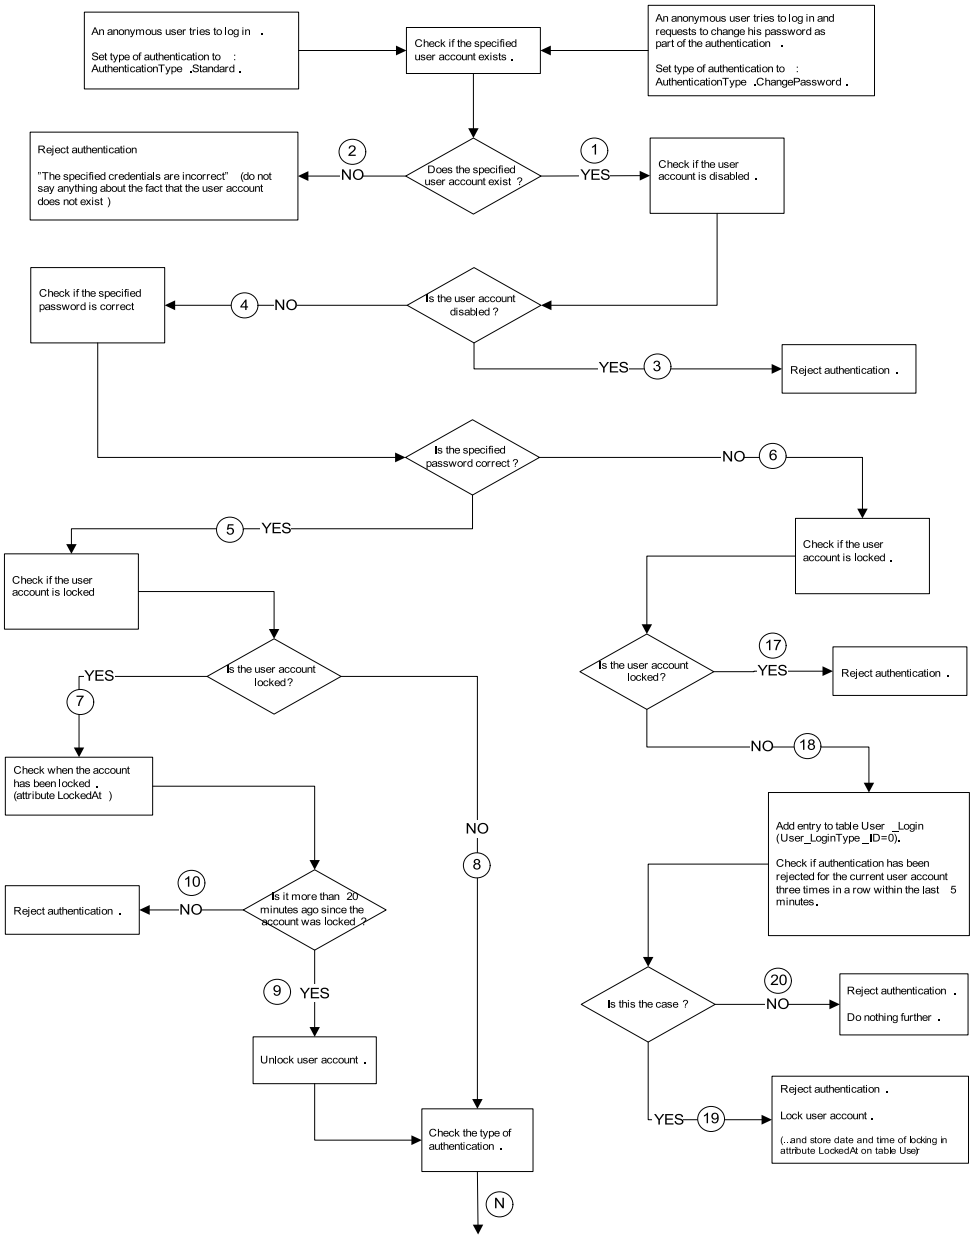
The namespace is divided into the subnamespaces described in the below table and are introduced according to the different primary navigation sections described in section 8.

Namespace	**Described in**
`StudyPlanning.UI.studyplanning`	Contains classes that support the ASPX pages responsible of presenting study plans, enabling students to manage their study plan criteria *&c.*
`StudyPlanning.DAL.coursebase`	Contains classes that support the ASPX pages responsible of presenting information related to courses. The namespace is introduced for illustrative purposes.
`StudyPlanning.DAL.studyinfo`	Contains classes that support the ASPX pages responsible presenting study info of various kinds. The namespace is introduced for illustrative purposes.
`StudyPlanning.DAL.controlpanel`	Contains classes that support the ASPX pages that enables the user to manage different settings in the system, including changing his password. The namespace is introduced for illustrative purposes.
`StudyPlanning.DAL.administration`	Contains classes that support the ASPX pages enabling administrative staff to configure global settings of the system. The namespace is introduced for illustrative purposes.

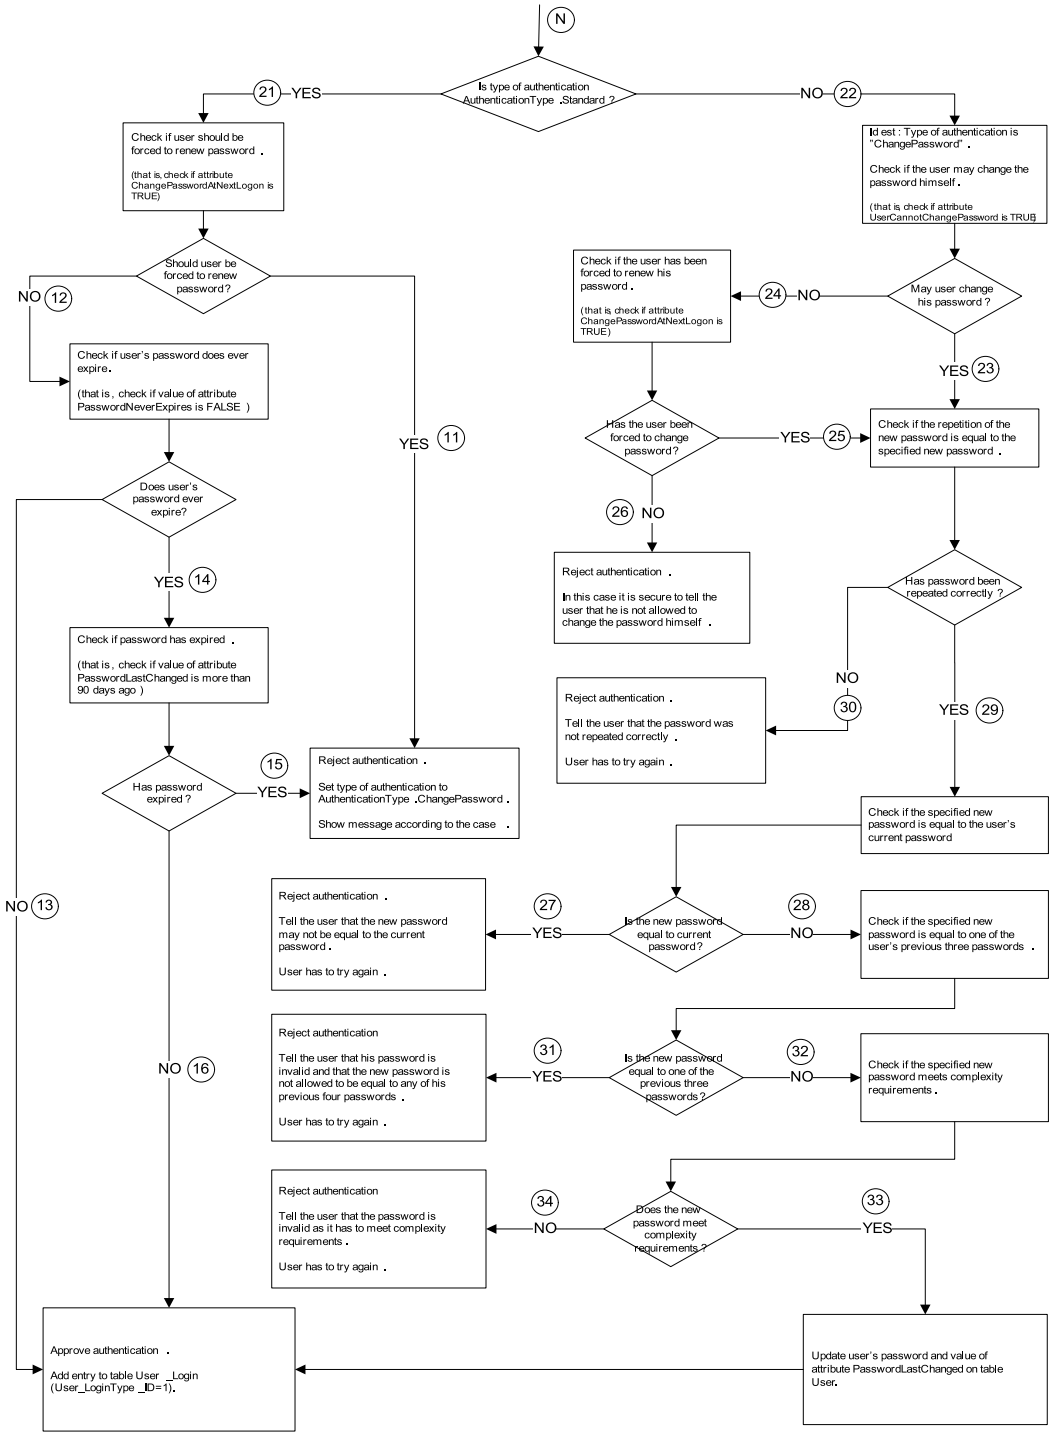
Appendix D

Authentication Decision Diagram

For reasons of space the decision diagram has been split up into two parts and each part has been placed on its own independent page beginning at next page.



An anonymous user tries to log in .
Set type of authentication to : AuthenticationType .Standard .
Check if the specified user account exists .
An anonymous user tries to log in and requests to change his password as part of the authentication .
Set type of authentication to : AuthenticationType .ChangePassword .
Reject authentication
"The specified credentials are incorrect" (do not say anything about the fact that the user account does not exist)
2
NO
Does the specified user account exist ?
1
YES
Check if the user account is disabled .
Check if the specified password is correct
4
NO
Is the user account disabled ?
YES
3
Reject authentication .
Is the specified password correct ?
NO
6
5
YES
Check if the user account is locked
Check if the user account is locked .
Is the user account locked?
YES
7
17
YES
Reject authentication .
NO
18
Check when the account has been locked . (attribute LockedAt)
Add entry to table User _Login (User_LoginType _ID=0).
Check if authentication has been rejected for the current user account three times in a row within the last 5 minutes.
NO
8
10
Reject authentication .
NO
Is it more than 20 minutes ago since the account was locked ?
9
YES
Is this the case ?
20
NO
Reject authentication .
Do nothing further .
Unlock user account .
YES
19
Reject authentication .
Lock user account .
(..and store date and time of locking in attribute LockedAt on table User)
Check the type of authentication .
N



N
Is type of authentication AuthenticationType .Standard ?
21
YES
NO
22
Check if user should be forced to renew password .
(that is, check if attribute ChangePasswordAtNextLogon is TRUE)
Id est : Type of authentication is "ChangePassword" .
Check if the user may change the password himself .
(that is, check if attribute UserCannotChangePassword is TRUE)
Should user be forced to renew password?
NO
12
Check if the user has been forced to renew his password .
(that is, check if attribute ChangePasswordAtNextLogon is TRUE)
24
NO
May user change his password ?
YES
23
Check if user's password does ever expire.
(that is, check if value of attribute PasswordNeverExpires is FALSE)
YES
11
Has the user been forced to change password?
YES
25
Check if the repetition of the new password is equal to the specified new password .
Does user's password ever expire?
26
NO
Reject authentication .
In this case it is secure to tell the user that he is not allowed to change the password himself .
YES
14
Has password been repeated correctly ?
Check if password has expired .
(that is, check if value of attribute PasswordLastChanged is more than 90 days ago)
NO
30
Reject authentication .
Tell the user that the password was not repeated correctly .
User has to try again .
YES
29
Has password expired ?
15
YES
Reject authentication .
Set type of authentication to AuthenticationType .ChangePassword .
Show message according to the case .
Check if the specified new password is equal to the user's current password
NO
13
Reject authentication .
Tell the user that the new password may not be equal to the current password .
User has to try again .
27
YES
Is the new password equal to current password?
28
NO
Check if the specified new password is equal to one of the user's previous three passwords .
Reject authentication
Tell the user that his password is invalid and that the new password is not allowed to be equal to any of his previous four passwords .
User has to try again .
31
YES
Is the new password equal to one of the previous three passwords?
32
NO
Check if the specified new password meets complexity requirements .
NO
16
Reject authentication
Tell the user that the password is invalid as it has to meet complexity requirements .
User has to try again .
34
NO
Does the new password meet complexity requirements ?
33
YES
Approve authentication .
Add entry to table User_Login (User_LoginType _ID=1).
Update user's password and value of attribute PasswordLastChanged on table User.

Data Tier

1.1 DalTypes

1.1.1 DalBool

```
using System;

namespace StudyPlanning.DAL
{
  /// <summary>
  /// Represents a Boolean value in the data access layer.
  /// </summary>
  public sealed class DalBool : DalType
  {
    private bool _Value;

    /// <summary>
    /// Initializes a new instance of the <see cref="StudyPlanning.DAL.DalBool">DalBool</see> class
    /// with the specified value of the Boolean.
    /// </summary>
    /// <param name="blnValue">The value of the Boolean.</param>
    /// <param name="allowNull">Indicates whether the value is allowed to be null.<br/>
    /// <strong>true</strong>, if the value is allowed to be null; otherwise, <strong>false</strong>.
    /// </param>
    public DalBool(bool blnValue, bool allowNull)
    {
      this.Value = blnValue;
      this._allowNull = allowNull;
    }

    /// <summary>
    /// Initializes a new instance of the <see cref="StudyPlanning.DAL.DalBool">DalBool</see> class.
    /// </summary>
    /// <param name="allowNull">Indicates whether the value is allowed to be null.<br/>
    /// <strong>true</strong>, if the value is allowed to be null; otherwise, <strong>false</strong>.
    /// </param>
    public DalBool(bool allowNull)
    {
      this._allowNull = allowNull;
    }

    /// <summary>
    /// Gets or sets the value of the integer.
    /// </summary>
    public bool Value
    {
      get { return this._Value; }
      set
      {
        this._Value = value;
        this._isNull = false;
      }
    }
  }
}
```

1.1.2 DalDateTime

```
using System;

namespace StudyPlanning.DAL
{
  /// <summary>
  /// Represents an instant in time in the data access layer,
  /// typically expressed as a date and time of day.
  /// </summary>
  public sealed class DalDateTime : DalType
  {
    private DateTime _Value;

    /// <summary>
    /// Initializes a new instance of the <see cref="StudyPlanning.DAL.DalDateTime">DalDateTime</see>
    /// class with the specified <see cref="System.DateTime">DateTime</see> object.
    /// </summary>
    /// <param name="dateTime">The <see cref="System.DateTime">DateTime</see> object.</param>
    /// <param name="allowNull">Indicates whether the value is allowed to be null.<br/>
    /// <strong>true</strong>, if the value is allowed to be null; otherwise, <strong>false</strong>.
    /// </param>
    public DalDateTime(DateTime dateTime, bool allowNull)
    {
      this.Value = dateTime;
      this._allowNull = allowNull;
    }

    /// <summary>
    /// Initializes a new instance of the <see cref="StudyPlanning.DAL.DalDateTime">DalDateTime</see>
    /// class.
    /// </summary>
    /// <param name="allowNull">Indicates whether the value is allowed to be null.<br/>
    /// <strong>true</strong>, if the value is allowed to be null; otherwise, <strong>false</strong>.
    /// </param>
    public DalDateTime(bool allowNull)
    {
      this._allowNull = allowNull;
    }

    /// <summary>
    /// Gets or sets the value of the instant in time.
    /// </summary>
    public DateTime Value
    {
      get { return this._Value; }
      set
      {
        this._Value = value;
        this._isNull = false;
      }
    }
  }
}
```

1.1.3 DalException

```
using System;
