Corrections to “Change Detection in Full and Dual Polarization, Single- and Multi-Frequency SAR Data”

Allan A. Nielsen^{ID}, Knut Conradsen, and Henning Skriver, *Member, IEEE*

Abstract—When the covariance matrix formulation is used for multi-look polarimetric synthetic aperture radar (SAR) data, the complex Wishart distribution applies. Based on this distribution a test statistic for equality of two complex variance-covariance matrices and an associated asymptotic probability of obtaining a smaller value of the test statistic are given. In a case study airborne EMISAR C- and L-band SAR images from the spring of 1998 covering agricultural fields and wooded areas near Foulum, Denmark, are used in single- and bi-frequency, bi-temporal change detection with full and dual polarimetry data.

Index Terms—Complex covariance matrix test statistic, complex wishart distribution, dual polarization, EMISAR, full polarization, remote sensing change detection, quad polarization.

In [1], wrong figures were printed on page 4044. The correct figures are shown here.
