AORTA: Adding Organizational Reasoning to Agents

Andreas Schmidt Jensen

Virginia Dignum

Technical University of Denmark, Kgs. Lyngby, Denmark Delft University of Technology, Delft, The Netherlands

We propose AORTA as a way to make agents **organization-aware** [4]. The AORTA system \rightarrow integrates organizational reasoning into existing agent platforms, and \rightarrow works with different organizational models.

Reasoning in **AORTA** is based on an organizational metamodel

- An **organizational model** is an explicit representation of an organization.
- Often based on **roles** and **objectives**
- \rightarrow Roles abstract implementation details away from expectation.
- \rightarrow Objectives define the desired outcome.
- \rightarrow Roles **depend** on each other for objective completion.
- AORTA supports different organizational models (e.g. OperA, \mathcal{M} OISE⁺).

role dependency.

2. Adding Organizational Reasoning to Agents

- AORTA provides organizational reasoning capabilities to agents.
- AORTA-agents are enriched with an organizational reasoning component (ORC).

ms

msg({

- The ORC divides organizational reasoning into
- \rightarrow organizational option generation (I **can** enact the role),
- \rightarrow organizational action deliberation (I enact the role), and
- \rightarrow organizational coordination (I **inform** others about my role).

Bob believes he can rescue people – $\Sigma_a \models can_rescue$.

 $bel(can_rescue) \implies consider(rea(bob, medic))$

Bob now considers the role enactment an option; he can enact the role:

 $opt(rea(bob, medic)) \land bel(no_medics < 2) \implies enact(medic)$

- 1. Alice enacts the medic role and informs Bob.
- 2. She finds an injured fan in one of the rooms, commits to rescuing him and informs Bob.
- 3. Bob informs that the fan is saved and Alice drops her commitment.

enact(medic)	(ACT)
$sg({bob}, org(rea(alice, medic)))$	(COORD)
bel(injured(fan1, room1))	(Ext)
commit (<i>rescue</i> (fan1))	(ACT)
<pre>pob}, bel(injured(fan1, room1)))</pre>	(Msg)
msg(bob, bel(rescued(fan1)))	(Chk)

drop(*rescue*(fan1))

(ACT)

5. Conclusion

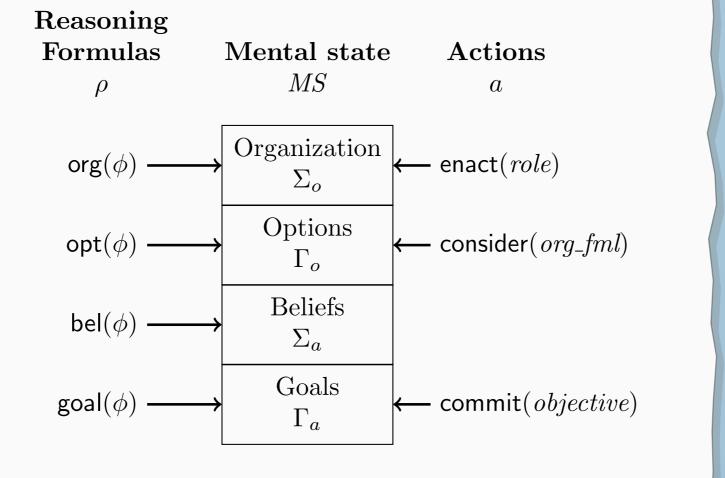

- Now
- AORTA provides agents with organizational reasoning capabilities.
- \rightarrow Integrates with BDI agents.
- \rightarrow Independent from the organization.
- Integrated into the **Jason** agent platform.
- Organization is decentralized.
- + Removes need for "gatekeepers".

Future

- Integration with other agent platforms.
- Model checking organization-aware agents.
- Support for norms and normative multi-agent systems.
- Centralization of certain aspects
- \rightarrow Extract organization into a shared component; an AORTA-organization.

3. Operational Semantics

- AORTA is formalized using structural operational semantics [3].
- Reasoning formulas **query** the mental state.
- Actions **alter** the mental state.
- Reasoning rules $\rho \implies a$ execute actions.
- \rightarrow Applicable when $MS \models \rho$ \rightarrow Transition function: $\mathcal{T}(a, MS) = MS'$

- Needs synchronization of organizational beliefs.

\rightarrow Using artifacts or a middleware.

- Can prove hard to regulate.
