

A Constraint Logic Programming Framework for the Synthesis of Fault-Tolerant Schedules for Distributed Embedded Systems

Kåre Harbo Poulsen,

Paul Pop, Viacheslav Izosimov

August 23, 2007

- Safety critical embedded systems
 - Hard real-time
 - Static schedules are necessary
 - Reliability is critical
 - Fault-tolerant
 - Battery powered
 - Energy consumption must be minimised

- Application with
 - Hard deadline
 - Reliability goal: 0.999,999,9
 - Minimise energy

	N ₁	N ₂
P ₁	10	X
P ₂	70	X
P ₃	X	40
P ₄	40	X
P ₅	X	40
P ₆	X	50

Fastest Schedule:

Deadline

$$R = 0.999\ 999\ 987$$

$$100\% E_0$$

Voltage levels

N ₁	100%	66%	33%
N ₂	100%	66%	33%

$$k = 1 \quad \text{⚡}$$

- Application with
 - Hard deadline
 - Reliability goal: 0.999,999,9
 - Minimise energy

	N ₁	N ₂
P ₁	10	X
P ₂	70	X
P ₃	X	40
P ₄	40	X
P ₅	X	40
P ₆	X	50

Energy Minimised:

R=0.999 999 878

68% E₀

Voltage levels

N ₁	100%	66%	33%
N ₂	100%	66%	33%

k = 1 ⚡

- Application with
 - Hard deadline
 - Reliability goal: 0.999,999,9
 - Minimise energy
 - Sacrifice 5% energy to meet reliability

	N ₁	N ₂
P ₁	10	X
P ₂	70	X
P ₃	X	40
P ₄	40	X
P ₅	X	40
P ₆	X	50

Reliable Energy Minimisation:

Deadline

$R=0.999\ 999\ 920$

73% E_0

Voltage levels

N ₁	100%	66%	33%
N ₂	100%	66%	33%

$k = 1$ ⚡

- Constraint Logic Programming
 - Good performance for NP-complete problems
 - Easily extendable model
- Heuristics
 - Complete: Variable- and value selection to guide search
 - Incomplete: Credit search to limit search to feasible space/time
